2.1 Identification of E.U.T.

Type of Equipment : Mobile Terminal Equipment
Model No. : EB-WX1GJ
Serial No. : No.7
Rating : DC5.0V (AC adaptor)
Li-ion polymer battery
Model:6027A0116401
3.7V / 6500mAh (24.1Wh)
Option battery: none
Size : (L)286 * (W)177*(H)14.7 Display:10.8inch
Accessory : Earphone (typical)
Receipt Date of Sample : November 8, 2010
Country of Mass-production : China
Condition of EUT : Production prototype
(Not for Sale: This sample is equivalent to mass-produced items.)
Modification of EUT : No Modification by the test lab

2.2 Product Description

Model No: EB-WX1GJ (referred to as the EUT in this report) is the Mobile Terminal Equipment.

General Specification

Clock frequency in the system : CPU: 800MHz

Radio Specification

Radio Type : Transceiver
Frequency of Operation : 2412-2462MHz
Modulation : DSSS
Power Supply (radio part input) : DC 3.3V /DC 1.8 V
Antenna type : Film Antenna
Antenna Gain : 2.87dBi

SECTION 3 : Test standard information

3.1 Requirements for compliance testing defined by the FCC

The US Federal Communications Commission has released the report and order "Guidelines for Evaluating the Environmental Effects of RF Radiation", ET Docket No. 93-62 in August 1996. The order requires routine SAR evaluation prior to equipment authorization of portable transmitter devices, including portable telephones. For consumer products, the applicable limit is 1.6 mW/g for an uncontrolled environment and 8.0 mW/g for an occupational/controlled environment as recommended by the ANSI/IEEE standard C95.1-1992. According to the Supplement C of OET Bulletin 65 "Evaluating Compliance with FCC Guide-lines for Human Exposure to Radio frequency Electromagnetic Fields", released on Jun 29, 2001 by the FCC, the device should be evaluated at maximum output power (radiated from the antenna) under "worst-case" conditions for normal or intended use, incorporating normal antenna operating positions, device peak performance frequencies and positions for maximum RF energy coupling.

1 Specific Absorption Rate (SAR) is a measure of the rate of energy absorption due to exposure to an RF transmitting source (wireless portable device).

2 IEEE/ANSI Std. C95.1-1992 limits are used to determine compliance with FCC ET Docket 93-62.

Supplement C (Edition 01-01) to OET Bulletin 65 (Edition 97-01):

Supplement C (Edition 01-01) - Additional Information for Evaluating Compliance of Mobile and Portable Devices with FCC Limits for Human Exposure to Radiofrequency Emissions

OET Bulletin 65 (Edition 97-01) - Evaluating Compliance with FCC Guidelines for Human Exposure to Radiofrequency Electromagnetic Fields

IEEE Std 1528-2003:

IEEE Recommended Practice for Determining the Peak Spatial-Average Specific Absorption Rate (SAR) in the Human Head from Wireless Communications Devices: Measurement Techniques Supplement C

Result of Max. SAR value

Max. SAR Value:

IEEE802.11b/g : 0.651W/kg (2412MHz)

3.3 Exposure limit

(A) Limits for Occupational/Controlled Exposure (W/kg)

Spatial Average (averaged over the whole body)	Spatial Peak (averaged over any 1g of tissue)	Spatial Peak (hands/wrists/feet/ankles averaged over 10g)
0.4	8.0	20.0

(B) Limits for General population/Uncontrolled Exposure (W/kg)

Spatial Average (averaged over the whole body)	Spatial Peak (averaged over any 1g of tissue)	Spatial Peak (hands/wrists/feet/ankles averaged over 10g)
0.08	1.6	4.0

Occupational/Controlled Environments: are defined as locations where there is exposure that may be incurred by people who are aware of the potential for exposure, (i.e. as a result of employment or occupation).

General Population/Uncontrolled Environments: are defined as locations where there is the exposure of individuals who have no knowledge or control of their exposure.

**NOTE:GENERAL POPULATION/UNCONTROLLED EXPOSURE
SPATIAL PEAK(averaged over any 1g of tissue) LIMIT
1.6 W/kg**

3.5 Confirmation before SAR testing

3.5.1 Correlation of Output Power between EMC and SAR tests

Correlation of Output Power between EMC and SAR tests (WLAN IEEE802.11b/g)

It was checked that the antenna port power was correlated within 0~+5% (FCC requirements)

SAR power is equal to DATA of EMC test. (November 9, 2010) based on the following reason.

- EMC and SAR tests are performed with the same test sample (S/N: No.7) under the same condition.
- EMC and SAR tests are performed at the same laboratory.
- The test mode setting is simple, and there is no possibility that the power (value) is changed by the wrong setting.

The result is shown in Section 6.

3.5.2 Average power for SAR testing

Step.1 Data rate check

The data rate check was measurement all data rate in the middle frequency of each frequency band.

Reference of modulation table

11b		11g	
Modulation	Data rate [Mbps]	Modulation	Data rate [Mbps]
DBPSK	1	BPSK	6
DQPSK	2	BPSK	9
CCK	5.5	QPSK	12
CCK	11	QPSK	18
-	-	16QAM	24
-	-	16QAM	36
-	-	64QAM	48
-	-	64QAM	54

Step.2 Decision of SAR test channel

Mode	GHz	Channel	"Default Test Channel"	
			FCC 15.247	
			802.11b	802.11g
802.11 b/g	2.412	1	√	Δ
	2.437	6	√	Δ
	2.462	11	√	Δ

√ = "default test channels"

Δ = Possible 802.11g channels with maximum average output 1/4 dB ≥ the "default test channels"

3.6 Confirmation after SAR testing

It was checked that the power drift [W] is within +/-5%. The verification of power drift during the SAR test is that DASY4 system calculates the power drift by measuring the E-field at the same location at beginning and the end of the scan measurement for each test position.

DASY4 system calculation Power drift value[dB] = $20\log(E_a)/(E_b)$

Before SAR testing : E_b [V/m]

After SAR testing : E_a [V/m]

Limit of power drift[W] = +/-5%

$X[\text{dB}] = 10\log[P] = 10\log(1.05/1) = 10\log(1.05) - 10\log(1) = 0.212\text{dB}$

from E-field relations with power.

$S = E \cdot H = E^2 / \eta = P / 4 \pi r^2$ (η : Space impedance)

$P = E^2 \cdot 4 \pi r^2 / \eta$

Therefore, The correlation of power and the E-field

$X_{\text{dB}} = 10\log(P) = 10\log(E)^2 = 20\log(E)$

From the above mentioned,

The calculated power drift of DASY4 System must be the less than +/-0.212dB.

3.7 Measurement procedure

1. IEEE 802.11b

Step1. The searching for the modulation

The 11b(DSSS) mode test was performed on the DBPSK(1Mbps) and CCK (11Mbps) modulations because the CCK(11Mbps) was maximum average power.

Step2. The searching for the worst position

This test was performed at the worst modulation of Step1.

Step3. Change to the Low and High channels

This test was performed at the worst conditions of Step2.

2. IEEE 802.11g

According to the KDB 248227 (Rev1.2) SAR Measurement Procedures for 802.11 a/b/g Transmitters, SAR is not required for 802.11g channels when the maximum average output power is less than $\frac{1}{4}$ dB higher than that measured on the corresponding 802.11b channels. Refer to the Section 6.

3.8 Test setup of EUT

When users operate or carry the EUT, it could be considered to touch or get close to their bodies. In order to assume this situation, we performed the test at the following positions. Please refer to "APPENDIX 1" for more details.

(1) Rear surface:

The test was performed in touch with rear surface of the transmitter to the flat phantom.

(2) Right edge :

The test was performed in touch with right edge of the transmitter to the flat phantom.

(3) Left edge:

The test was performed in touch with left edge of the transmitter to the flat phantom.

(4) Top edge:

The test was performed in touch with top edge of the transmitter to the flat phantom.

(5) Bottom edge:

The test was performed in touch with bottom edge of the transmitter to the flat phantom.

SECTION 4 : Operation of E.U.T. during testing

4.1 Operating modes for SAR testing

4.1.1 Setting of EUT

This EUT was tested in IEEE.802.11b/g continuous transmitting modes by the following test tool.

Software name for test tool	: adb version 7.0.0.0
Power setting	: 11b:17dBm 11g:15dBm

The frequency band and the modulation used in the testing of IEEE.802.11b /g are shown as a following.

1. IEEE 802.11b mode

Tx frequency band	: 2412-2462MHz
Channel	: 1ch(2412MHz),6ch(2437MHz),11ch(2462MHz)
Modulation	: DSSS
Crest factor	: 1 (Duty 100%)

2. IEEE 802.11g mode

Tx frequency band	: 2412-2462MHz
Channel	: 1ch(2412MHz),6ch(2437MHz),11ch(2462MHz)
Modulation	: OFDM
Crest factor	: 1 (Duty 100%)

Note: IEEE802.11g mode was measured in power testing only.
