#### 6.7 AC Powerline Conducted Emission

The preliminary tests were performed using the scan mode of test receiver or spectrum analyzer to observe the emissions characteristics of the EUT.

The EUT configuration, cable configuration and mode of operation were determined for producing the maximum level of emissions.

This configurations was used for final tests.

#### 11 Summary

#### General Remarks:

The EUT was tested according to the requirements of the following standard.

CFR 47 FCC Rules and Regulations Part 15

The test configuration is shown in clause 12 to 14.

The conclusion for the test items of which are required by the applied regulation is indicated under the test results.

Determining compliance with the limits in this report was based on the results of the compliance measurement, not taking into account measurement instrumentation uncertainty.

#### **Test Results:**

The "as received" sample;

☐ - fulfill the test requirements of the regulation mentioned on clause 1.

odoesn't fulfill the test requirements of the regulation mentioned on clause 1.

### A.3 Occupied Bandwidth

<u>Test Date</u>: <u>July 22, 2011</u> <u>Temp.:28°C, Humi:66%</u>

The resolution bandwidth was set to about 1% of emission bandwidth, -20dBc display line was placed on the screen (or 99% bandwidth), the occupied bandwidth is the delta frequency between the two points where the display line intersects the signal trace.

#### A.4 Dwell Time

<u>Test Date</u>: July 22, 2011 <u>Temp.:28°C, Humi:66%</u>

| Mode of EUT | Dwell Time<br>(msec) |
|-------------|----------------------|
| DH1         | 122.2                |
| DH3         | 262.4                |

DH1(Modulation type: GFSK)

Note: The system makes worst case 1600 hops per second or 1 time slot has a length of  $625~\mu s$  with 79 channels. A DH1 Packet need 1 time slot for transmitting and 1 time slot for receiving. Then the system makes worst case 800 hops per second with 79 channels. So the system has each channel 10.1266 times per second and so for 31.6 seconds the system have 320.0 times of appearance.

Each tx-time per appearance is 0.382 ms.

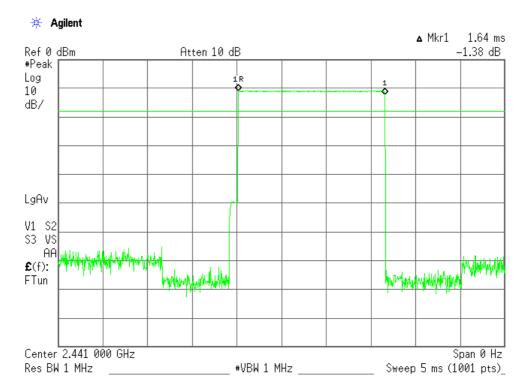

Dwell time = 320.0 \* 0.382 = 122.2 ms

Regulation : CFR 47 FCC Rules and Regulations Part 15

Page 35 of 56

#### DH3(Modulation type : GFSK)

Note: A DH3 Packet need 3 time slot for transmitting and 1 time slot for receiving. Then the system makes worst case 400 hops per second with 79 channels. So the system have each channel 5.063 times per second and so for 31.6 seconds the system have 160.0 times of appearance. Each tx-time per appearance is 1.640 ms.

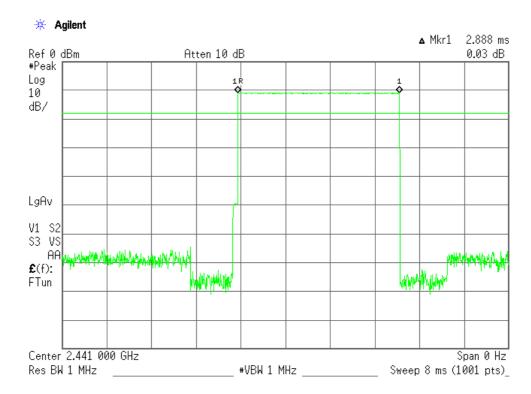

Dwell time = 160.0 \* 1.640 = 262.4 ms

Regulation : CFR 47 FCC Rules and Regulations Part 15

Page 36 of 56

#### DH5(Modulation type : GFSK)

Note: A DH5 Packet need 5 time slot for transmitting and 1 time slot for receiving. Then the system makes worst case 266.667 hops per second with 79 channels. So the system have each channel 3.3755 times per second and so for 31.6 seconds the system have 106.7 times of appearance. Each tx-time per appearance is 2.888 ms.

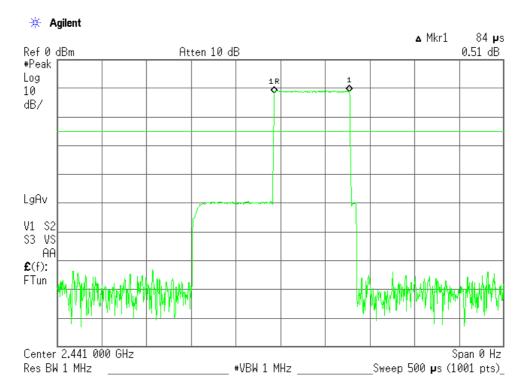

Dwell time = 106.7 \* 2.888 = 308.1ms

Regulation : CFR 47 FCC Rules and Regulations Part 15

# Inquiry

Note: The system have 32 hopping channel in Inquiry mode.

The time period = 32 \* 0.4 = 12.8 seconds

In maximum case the bluetooth system have three blocks of 2560 ms in 12.8 s period. One block has 256 burst at each hopping channel.

Each tx-time per appearance is 0.084 ms.

Dwell time = 0.084 \* 256 \* 3 = 64.5 ms

#### NOTES

- 1. Test Distance : 3 m  $\,$
- $2. \ The \ spectrum \ was \ checked \ from \ 1 \ GHz \ to \ 25 \ GHz \ (10th \ harmonic \ of \ the \ highest \ fundamental \ frequency).$
- 3. The correction factor is shown as follows:

Corr. Factor [dB] = Cable Loss + 20dB Pad Att. - Pre-Amp. Gain [dB] (1.0 - 7.6GHz)

Corr. Factor [dB] = Cable Loss + 10dB Pad Att. - Pre-Amp. Gain [dB]  $(7.6 - 18.0 \mathrm{GHz})$ 

Corr. Factor [dB] = Cable Loss - Pre-Amp. Gain [dB] (over 18 GHz)
