

Report on the Radio Testing  
For  
Pektron Group Limited  
On  
BTLE NFC Node  
Report no. TRA-051982-47-02B  
2021-05-18

RF915 7.0

Report Number: TRA-051982-47-02B  
Issue: B

REPORT ON THE RADIO TESTING OF A  
Pektron Group Limited  
BTLE NFC Node  
WITH RESPECT TO SPECIFICATION  
FCC 47CFR 15.247

TEST DATE: 2021-02-22 to 2021-02-26

Written by:

Steven Garwell  
Radio Test Engineer

Approved by:

Date:

2021-05-18

Daniel Winstanley  
Senior – Radio Test Engineer

Disclaimers:

- [1] THIS DOCUMENT MAY BE REPRODUCED ONLY IN ITS ENTIRETY AND WITHOUT CHANGE  
[2] THE RESULTS CONTAINED IN THIS DOCUMENT RELATE ONLY TO THE ITEM(S) TESTED

## 1 Revision Record

| <i>Issue Number</i> | <i>Issue Date</i> | <i>Revision History</i>                         |
|---------------------|-------------------|---|
| A                   | 2021-04-19        | Original  |
| B                   | 2021-05-18        | Updated FCC ID, Antenna Gain and SAR assessment |

## 2.1 Test Summary

| Test Method and Description   |      | Requirement Clause | Applicable to this equipment        | Result / Note |
|---|------|--------------------|-------------------------------------|---------------|
| <b>47CFR15</b>  |      |                    |                                     |               |
| Radiated spurious emissions (restricted bands of operation and cabinet radiation) |      | 15.205             | <input checked="" type="checkbox"/> | Pass          |
| AC power line conducted emissions   |      | 15.207             | <input type="checkbox"/>            | Note 1        |
| Occupied bandwidth  |      | 15.247(a)(2)       | <input checked="" type="checkbox"/> | Pass          |
| Conducted carrier power   | Peak | 15.247(b)(3)       | <input checked="" type="checkbox"/> | Pass          |
|   | Max. |                    | <input type="checkbox"/>            |               |
| Conducted / radiated RF power out-of-band   |      | 15.247(d)          | <input checked="" type="checkbox"/> | Pass          |
| Power spectral density, conducted   |      | 15.247(e)          | <input checked="" type="checkbox"/> | Pass          |
| Calculation of duty correction  |      | 15.35(c)           | <input checked="" type="checkbox"/> | -             |

**Note 1:** Not applicable, not connected to the mains.

### Notes:

The results contained in this report relate only to the items tested, in the condition at time of test, and were obtained in the period between the date of initial receipt of samples and the date of issue of the report.

The apparatus was set up and exercised using the configurations, modes of operation and arrangements defined in this report only. Any modifications made are identified in Section 8 of this report.

Particular operating modes, apparatus monitoring methods and performance criteria required by the standards tested to have been performed except where identified in Section 5.2 of this test report (Deviations from Test Standards).

## 4 Introduction

This report TRA-051982-47-02B presents the results of the Radio testing on a Qualcomm Technologies International Ltd., BTLE NFC Node to specification 47CFR15 Radio Frequency Devices.

The testing was carried out for Pektron Group Limited, by Element, at the address detailed below.

|                          |   |                                     |  |
|--------------------------|---|-------------------------------------|--|
| <input type="checkbox"/> | Element Hull<br>Unit E<br>South Orbital Trading Park<br>Hedon Road<br>Hull<br>HU9 1NJ<br>UK | <input checked="" type="checkbox"/> | Element Skelmersdale<br>Unit 1<br>Pendle Place<br>Skelmersdale<br>West Lancashire<br>WN8 9PN<br>UK |
|--------------------------|---|-------------------------------------|--|

This report details the configuration of the equipment, the test methods used and any relevant modifications where appropriate.

All test and measurement equipment under the control of the laboratory and requiring calibration is subject to an established programme and procedures to control and maintain measurement standards. The quality management system meets the principles of ISO 9001, and has quality control procedures for monitoring the validity of tests undertaken. Records and sufficient detail are retained to establish an audit trail of calibration records relating to its test results for a defined period. Under control of the established calibration programme, key quantities or values of the test & measurement instrumentation are within specification and comply with the relevant traceable internationally recognised and appropriate standard specifications, which are UKAS calibrated as such where these properties have a significant effect on results. Participation in inter-laboratory comparisons and proficiency testing ensures satisfactory correlation of results conform to Elements own procedures, as well as statistical techniques for analysis of test data providing the appropriate confidence in measurements.

Throughout this report EUT denotes equipment under test.

FCC Site Listing:

The test laboratory is accredited for the above sites under the US-UK MRA,

|                        |        |
|------------------------|--------|
| Designation number(s): |        |
| Element Hull           | UK2007 |
| Element Skelmersdale   | UK2020 |

|                            |       |
|----------------------------|-------|
| IC Registration Number(s): |       |
| Element Hull               | 3483A |
| Element Skelmersdale       | 3930B |

The test site requirements of ANSI C63.4-2014 are met up to 1GHz.

The test site SVSWR requirements of CISPR 16-1-4:2010 are met over the frequency range 1 GHz to 18 GHz.

## **5 Test Specifications**

### **5.1 Normative References**

- FCC 47 CFR Ch. I – Part 15 – Radio Frequency Devices.
- ANSI C63.10-2013 – American National Standard of Procedures for Compliance Testing of Unlicensed Wireless Devices.
- ANSI C63.4-2014 – American National Standard for Methods of Measurement of Radio-Noise Emissions from Low-Voltage Electrical and Electronic Equipment in the Range of 9 kHz to 40 GHz.

### **5.2 Deviations from Test Standards**

There were no deviations from the test standard.

## 6 Glossary of Terms

## 7 Equipment Under Test

### 7.1 EUT Identification

- Name: BTLE NFC Node
- Model Number: A-0819G02
- Serial Numbers: AB10001253 (Radiated) AB10001263 (Conducted)
- Software Versions: Bootloader: P0819B1.0.4 / Application: P0819A2.1.2
- Hardware Version: Production

### 7.2 System Equipment

Equipment listed below forms part of the overall test setup and is required for equipment functionality and/or monitoring during testing. The compliance levels achieved in this report relate only to the EUT and not items given in the following list.

1. Dell Vostro Laptop

### 7.3 EUT Mode of Operation

#### 7.3.1 Transmission

The mode of operation for transmit tests was as follows:-

The EUT was transmitting modulated carrier on the frequencies indicated.

### 7.4 EUT Radio Parameters

|                                |                     |
|--------------------------------|---------------------|
| <b>Frequency of operation:</b> | 2402 MHz – 2480 MHz |
| <b>Modulation:</b>             | GFSK                |
| <b>Declared output power:</b>  | ≤10.0 dBm           |
| <b>Antenna type:</b>           | PCB Trace           |
| <b>Antenna gain:</b>           | Unknown             |
| <b>Nominal supply voltage:</b> | 12 Vdc              |

### 7.5 EUT Description

The EUT is a BTLE / NFC node incorporating BTLE 2.4 GHz, NFC 13.6 MHz and a LF 135 kHz radios, this report covers the testing of the Bluetooth radio only.

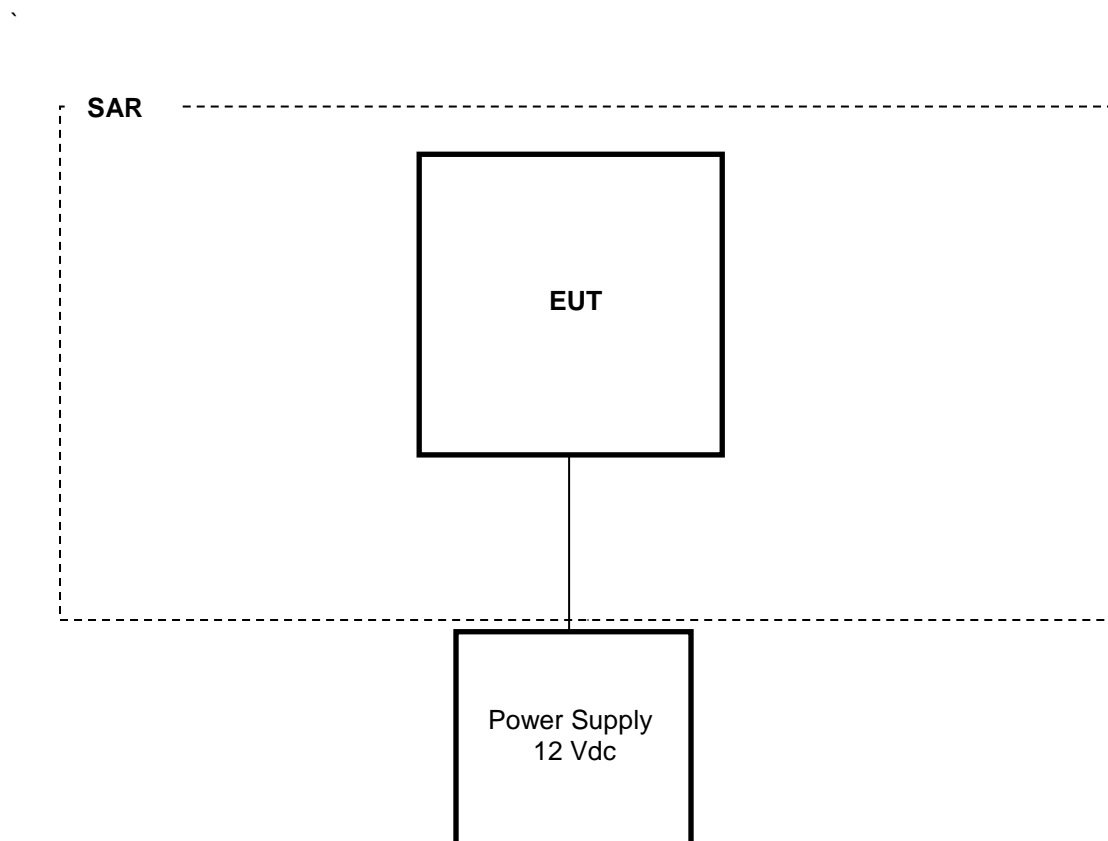

## **8 Modifications**

No modifications were performed during this assessment.

## 9 EUT Test Setup

### 9.1 Block Diagram

The following diagram shows basic EUT interconnections with cable type and cable lengths identified:

## 9.2 General Setup Photograph

The following photograph shows basic EUT set-up:

## 9.3 Measurement software

Where applicable, the following software was used to perform measurements contained within this report.

Element Emissions R5 (See Note)  
Element Transmitter Bench Test (See Note)  
ETS Lindgren EMPower V1.0.4.2

Note:

The version of the Element software used is recorded in the results sheets contained within this report.

## **10 General Technical Parameters**

### ***10.1 Normal Conditions***

The EUT was tested under the normal environmental conditions of the test laboratory, except where otherwise stated. The normal power source applied was 12 Vdc from an external power supply.

## 11 Radiated emissions

### 11.1 Definitions

#### *Spurious emissions*

Emissions on a frequency or frequencies, which are outside the necessary bandwidth and the level of which may be reduced without affecting the corresponding transmission of information. Spurious emissions include harmonic emissions, parasitic emissions, intermodulation products and frequency conversion products, but exclude out-of-band emissions.

#### *Restricted bands*

A frequency band in which intentional radiators are permitted to radiate only spurious emissions but not fundamental signals.

### 11.2 Test Parameters

|                           |  |
|---------------------------|--|
| Test Location:            | Element Skelmersdale   |
| Test Chamber:             | SK03 radio chamber   |
| Test Standard and Clause: | ANSI C63.10-2013, Clause 6.5 and 6.6                         |
| Frequencies Measured:     | 2402 MHz / 2440 MHz / 2480 MHz                               |
| EUT Channel Bandwidths:   | 1 MHz  |
| Deviations From Standard: | None   |

### 11.3 Test Limit

Unwanted emissions that fall within the restricted frequency bands shall comply with the limits specified:

#### **General Field Strength Limits for License-Exempt Transmitters at Frequencies above 30 MHz**

| <b>Frequency<br/>(MHz)</b> | <b>Field Strength<br/>(<math>\mu\text{V/m}</math> at 3 m)</b> |
|----------------------------|---|
| 30 to 88                   | 100   |
| 88 to 216                  | 150   |
| 216 to 960                 | 200   |
| Above 960                  | 500   |

## 11.4 Test Method

With the EUT setup as per section 9 of this report and connected as per Figure i, the emissions from the EUT were measured on a spectrum analyzer / EMI receiver.

Radiated electromagnetic emissions from the EUT are checked first by preview scans. Preview scans for all spectrum and modulation characteristics are checked, using a peak detector and where applicable worst-case determined for function, operation, orientation, etc. for both vertical and horizontal polarisations. Pre-scan plots are shown with a peak detector and 100 kHz RBW.

If the EUT connects to auxiliary equipment and is table or floor standing, the configurations prescribed in ANSI C63.10 are followed. Alternatively, a layout closest to normal use (as declared by the provider) is employed, (see EUT setup photographs for more detail).

Emissions between 30 MHz and 1 GHz are measured using calibrated broadband antennas. Emissions above 1 GHz are characterized using standard gain horn antennas. Pre-amplifiers and filters are used where required. Care is taken to ensure that test receiver resolution bandwidth, video bandwidth and detector type(s) meet the regulatory requirements.

For both horizontal and vertical polarizations, the EUT is then rotated through 360 degrees in azimuth until the highest emission is detected. At the previously determined azimuth the test antenna is raised and lowered from 1 to 4 m in height until a maximum emission level is detected, this maximum value is recorded.

Power values measured on the test receiver / analyzer are converted to field strength, FS, in dBμV/m at the regulatory distance, using:

$$FS = PR + CL + AF - PA + DC - CF$$

$$\text{Factor} = CL + AF - PA$$

Where,

PR is the power recorded on the receiver / spectrum analyzer in dBμV;

CL is the cable loss in dB;

AF is the test antenna factor in dB/m;

PA is the pre-amplifier gain in dB (where used);

DC is the duty correction factor in dB (where used, e.g. harmonics of pulsed fundamental);

CF is the distance factor in dB (where measurement distance different to limit distance);

This field strength value is then compared with the regulatory limit.

## BLE1 radiated band edge – Peak

Date: 25.FEB.2021 11:07:54

## BLE1 radiated band edge – Average

Date: 25.FEB.2021 11:14:34

**Note:** The average band edge measurement was taken at a distance of 1 metre this was to meet the system measurement noise floor. The duty cycle offset was adjusted to facilitate the change in measurement distance.

## 12 Occupied Bandwidth

### 12.1 Definition

The emission bandwidth (x dB) is defined as the frequency range between two points, one above and one below the carrier frequency, at which the spectral density of the emission is attenuated x dB below the maximum in-band spectral density of the modulated signal.

### 12.2 Test Parameters

## 13 Maximum peak conducted output power

### 13.1 Definition

The maximum peak conducted output power is defined as the maximum power level measured with a peak detector using a filter with width and shape of which is sufficient to accept the signal bandwidth.

The maximum conducted output power is defined as the total transmit power delivered to all antennas and antenna elements averaged across all symbols in the signaling alphabet when the transmitter is operating at its maximum power control level.

### 13.2 Test Parameters

|  |                                 |
|--|---------------------------------|

| Measurement Detector:  | Peak                            |

### Environmental Conditions (Normal Environment)

|                    |                                  |
|--------------------|----------------------------------|
| Temperature: 24 °C | +15 °C to +35 °C (as declared)   |
| Humidity: 37 % RH  | 20 % RH to 75 % RH (as declared) |

### 13.3 Test Limit

For systems employing digital modulation techniques operating in the bands 902 to 928 MHz, 2400 to 2483.5 MHz and 5725 to 5850 MHz, the maximum peak conducted output power shall not exceed 1 W.

### 13.4 Test Method

With the EUT setup as per section 9 of this report and connected as per Figure iv, the resolution bandwidth of the spectrum analyser was increased above the EUT occupied bandwidth and the peak emission data noted.

The measurements were performed with EUT set at its maximum duty. All modulation schemes, data rates and power settings were used to observe the worst-case configuration in each bandwidth.

**Figure iv Test Setup**

### 13.5 Test Equipment

### 13.6 Test Result

The following formula may be used to convert field strength (FS) in volts/metre to transmitter output power (TP) in watts:

$$TP = (FS \times D)^2 / (30 \times G)$$

where D is the distance in metres between the two antennas and G is the antenna numerical gain referenced to isotropic gain.

| <i>Modulation: GFSK; Data Rate 1 Mb/s; Power Setting: Default</i> |                                     |                     |                       |                   |                |
|---|-------------------------------------|---------------------|-----------------------|-------------------|----------------|
| <i>Frequency (MHz)</i>  | <i>Peak Field Strength (dBμV/m)</i> | <i>Distance (m)</i> | <i>Numerical Gain</i> | <i>Power (mW)</i> | <i>Verdict</i> |
| 2402  | 97.9                                | 3                   | 1                     | 1.84926           | Pass           |
| 2440  | 96.5                                | 3                   | 1                     | 1.33967           | Pass           |
| 2480  | 96.6                                | 3                   | 1                     | 1.37088           | Pass           |

Note: power measurement was taken radiated as antenna gain was unknown.

## 14 Out-of-band and conducted spurious emissions

### 14.1 Definition

#### *Out-of-band emission.*

Emission on a frequency or frequencies immediately outside the necessary bandwidth that results from the modulation process but excluding spurious emissions.

#### *Spurious emission.*

Emission on a frequency or frequencies that are outside the necessary bandwidth and the level of which may be reduced without affecting the corresponding transmission of information. Spurious emissions include harmonic emissions, parasitic emissions, intermodulation products, and frequency conversion products, but exclude out-of-band emissions.

### 14.2 Test Parameters

| Humidity: 37 % RH  | 20 % RH to 75 % RH (as declared) |
| Supply: 12 Vdc     | 12 Vdc (as declared)             |

### 14.3 Test Limit

In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated device is operating, the RF power that is produced shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement, provided that the transmitter demonstrates compliance with the peak conducted power limits. If the transmitter complies with the conducted power limits based on the use of root-mean-square averaging over a time interval, the attenuation required shall be 30 dB instead of 20 dB. Attenuation below the general field strength limits specified in FCC 47CFR15.209(a) / RSS-Gen is not required.

#### 14.4 Test Method

With the EUT setup as per section 9 of this report and connected as per Figure v, the emissions from the EUT were measured on a spectrum analyser.

The measurements were performed with EUT set at its maximum duty. All modulation schemes, data rates and power settings were used to observe the worst case configuration in each bandwidth.

| Supply: 12 Vdc     | 12 Vdc (as declared)             |

### 15.3 Test Limit

The transmitter power spectral density conducted from the transmitter to the antenna shall not be greater than 8 dBm in any 3 kHz band during any time interval of continuous transmission.

### 15.4 Test Method

With the EUT setup as per section 9 of this report and connected as per Figure vi, the peak emission of the EUT was measured on a spectrum analyser, with path losses taken into account.

The measurements were performed with EUT set at its maximum duty. All modulation schemes, data rates and power settings were used to observe the worst case configuration in each bandwidth.

| Humidity: 37 % RH  | 20 % RH to 75 % RH (as declared) |

### 16.3 Test Limit

N/A.

## 16.4 Test Method

With the EUT setup as per section 9 of this report and connected as per Figure vii, the duty of the EUT was calculated from the sum of total on and off times over the observation period.

The measurements were performed with EUT set at its maximum duty. All modulation schemes, bandwidths, data rates and power settings were measured

[1] Single antenna output devices

Duty was measured at the antenna port / at a distance of 3 m.

[2] Multiple antenna output devices

Duty was measured as the combination of all ports simultaneously / at a distance of 3 m.

The duty cycle correction factor, DC, shall be added to the measurement results prior to comparing with the emission limit to compute the emission level that would have been measured had the test been performed at 100% duty cycle. The correction factor is computed as:

- 1) If power averaging (rms) mode was used in step f), then the applicable correction factor is  $[10 \log (1 / D)]$ , where  $D$  is the duty cycle.
- 2) If linear voltage averaging mode was used in step f), then the applicable correction factor is  $[20 \log (1 / D)]$ , where  $D$  is the duty cycle.
- 3) If a specific emission is demonstrated to be continuous ( $D \geq 98\%$ ) rather than turning ON and OFF with the transmit cycle, then no duty cycle correction is required for that emission.

## 17 Measurement Uncertainty

### Calculated Measurement Uncertainties

All statements of uncertainty are expanded standard uncertainty using a coverage factor of 1.96 to give a 95 % confidence:

#### [1] Radiated spurious emissions

Uncertainty in test result (30 MHz to 1 GHz) = **4.75 dB**

Uncertainty in test result (1 GHz to 18 GHz) = **4.46 dB**

#### [2] AC power line conducted emissions

Uncertainty in test result = **3.2 dB**

#### [3] Occupied bandwidth

Uncertainty in test result = **15.58 %**

#### [4] Conducted carrier power

Uncertainty in test result (Power Meter) = **0.93 dB**

#### [5] Conducted RF power out-of-band

Uncertainty in test result – up to 8.1 GHz = **3.31 dB**

Uncertainty in test result – 8.1 GHz to 15.3 GHz = **4.43 dB**

#### [6] Radiated RF power out-of-band

Uncertainty in test result (30 MHz to 1 GHz) = **4.75 dB**

Uncertainty in test result (1 GHz to 18 GHz) = **4.46 dB**

#### [7] Power spectral density

Uncertainty in test result (Spectrum Analyser) = **3.11 dB**

#### [8] ERP / EIRP

Uncertainty in test result (Laboratory) = **4.71 dB**

Uncertainty in test result (Pershore OATS) = **4.26 dB**

## 18 MPE Calculation

### Prediction of MPE limit at a given distance

For purposes of these requirements mobile devices are defined by the FCC as transmitters designed to be used in other than fixed locations and to generally be used in such a way that a separation distance of at least 20 centimeters is normally maintained between radiating structures and the body of the user or nearby persons. These devices are normally evaluated for exposure potential with relation to the MPE limits. As the 20 cm separation specified under FCC rules may not be achievable under normal operation of the EUT, an RF exposure calculation is needed to show the minimum distance required to be less than the power density limit, as required under FCC rules.

Equation from IEEE C95.1

$$S = \frac{EIRP}{4\pi R^2} \text{ re - arranged } R = \sqrt{\frac{EIRP}{S 4\pi}}$$

Where:

S = power density

R = distance to the centre of radiation of the antenna

EIRP = EUT Maximum power

Result

| <b>Channel Frequency<br/>(MHz)</b> | <b>EIRP<br/>(mW)</b> | <b>Power density limit (S)<br/>(mW/cm<sup>2</sup>)</b> | <b>Distance (R) cm<br/>required to be less<br/>than the power density<br/>limit</b> |
|------------------------------------|----------------------|--|---|
| 2402                               | 1.8                  | 1.0  | 0.4   |
| 2440                               | 1.3                  | 1.0  | 0.3   |
| 2480                               | 1.4                  | 1.0  | 0.3   |

See intermodulation report TRA-051982-47-08A for simultaneous operation assessment.
