Nokia Global Product Compliance Laboratory represents to the client that testing was done in accordance with standard procedures as applicable, and that reported test results are accurate within generally accepted commercial ranges of accuracy in accordance with the scope of our NVLAP Accreditation. Nokia Global Product Compliance reports only apply to the specific samples tested. This report is the property of the client. This report shall not be reproduced except in full without the written approval of the Nokia Global Product Compliance Laboratory.

Nokia Global Product Compliance Laboratory is accredited with the US Department of Commerce National Institute of Standards and Technology's National Voluntary Laboratory Accreditation Program (NVLAP) for satisfactory compliance with criteria established in Title 15, Part 7 Code of Federal Regulations for offering test services for selected test methods in Electromagnetic Compatibility; Voluntary Control Council for Interference (VCCI), Japan; Australian Communications and Media Authority (ACMA). The laboratory is ISO 9001:2008 Certified.

Nokia Global Product Compliance Laboratory represents to the client that the laboratory's accreditation or any of its calibration or test reports in no way constitutes or implies product certification, approval, or endorsement by NVLAP, NIST, or any agency of the federal government.

1. ATTESTATION OF TEST RESULTS

Company Name	Alcatel-Lucent USA, Inc.
FCC ID	AS5BBTRX-28
Product Name	B66a RRH 4x45W
Model Name	AWS LTE B66a RRH 4x45W
Part No	3JR59011AAAC, P2
Serial Number(s)	LBALLU-YD160403FA7
Test Standard(s)	47 CFR FCC Part 27
Reference(s)	• 47 CFR FCC Part 2 and Part 27 • FCC KDB 971168 D01 (October 17, 2014) • ANSI C63.4 (2009) • 3GPP TS 36.104 v12.6.0 (2015-02)
Operating Frequency Band	AWS (Tx: 2110 - 2180 MHz and Rx: 1710 – 1780 MHz), E-UTRAN Band 66a (AWS-1 + AWS-3)
Technology	LTE
Test Frequency Range	10 MHz – 22 GHz
Operation Mode(s)	2x90W MIMO and 4x45W MIMO
Submission Type	Class II Permissive Change
FCC Part 15 Subpart B Compliance	Compliance with Class B
Test Date	July 25 – September 15, 2016
Test Laboratory	Global Product Compliance Laboratory 600-700 Mountain Avenue, Rm 5B-108 Murray Hill, New Jersey 07974-0636 USA

This is to certify that the above product has been evaluated and found to be in compliance with the Rules and Regulations set forth in the above standard(s). The data and the descriptions about the test setup, procedures and configuration presented in this report are accurate. The results of testing in this report apply only to the product/system which was tested. Other similar equipment will not necessarily produce the same results due to production tolerance and measurement uncertainties.

Per the requirement of Section 2.911(d) Certification of Technical Test Data, I hereby certify that the technical test data are the results of tests either performed or supervised by me.

Michael P. Farina
Member of Technical Staff

Alcatel-Lucent USA, Inc

2. SUMMARY OF THE TEST RESULTS

47 CFR FCC Sections	Description of Tests	Compliance Results	Notes
2.1046	RF Power Output	Yes	
2.1047	Modulation Characteristics	Yes	
2.1049, 27.53(h)	(a) Occupied Bandwidth (b) Out-of-Band Emissions	Yes	
2.1051, 27.53(h)	Spurious Emissions at Antenna Terminals	Yes	
2.1053, 27.53(h)	Field Strength of Spurious Radiation	Yes	
2.1055, 27.54	Measurement of Frequency Stability	NR	

NR: Not Required

NA: Not Applicable

2.1 Measurement Uncertainty

The results of the calculations to estimate uncertainties for the several test methods and standards are shown in the Table below. These are the worst-case values.

Worst-Case Estimated Measurement Uncertainties

Standard, Method or Procedure	Condition	Frequency MHz	Expanded Uncertainty (k=2)
a. Classical Emissions, (<i>e.g.</i> , ANSI C63.4, CISPR 11, 14, 22, <i>etc.</i> , using ESHS 30,	Conducted Emissions	0.009 - 30	±3.5 dB
	Radiated Emissions (AR-4 Semi-Anechoic Chamber)	30 MHz – 200MHz 200 MHz – 1000 MHz	±5.1 dB ±4.7 dB

2.2 Measurement uncertainty for Antenna Port Testing:

- 9 kHz to 20 MHz: Frequency = 10 Hz, Amplitude = 0.5 dB
- 20 MHz to 1 GHz: Frequency = 100Hz, Amplitude = 0.5 dB
- 1 GHz to 10 GHz: Frequency = 10 kHz, Amplitude = 0.5 dB

3. GENERAL INFORMATION

3.1 Product Descriptions

The equipment under test (EUT) has the following specifications.

Table 3.1.1 Product Specifications

Specification Items	Description
Product Type	Remote Radio Head (RRH) (4Tx, 4Rx), 2x90W MIMO (2T4R) and 4x45W MIMO (4T4R)
Radio Type	Intentional Transceiver
Power Type	- 48 Vdc , 14 Adc nominal
Modulation	QPSK, 16QAM, 64QAM
Operating Frequency Range	Tx 2110 - 2180 MHz/Rx 1710-1780 MHz
Channel Bandwidth	5, 10, 15 and 20 MHz
Max Conducted Power (Rated)	46.53 dBm per port for 4T4R and 49.54dBm per port for 2T4R
Min Conducted Power (Rated)	30.53 dBm per port for 4T4R and 33.54dBm per port for 2T4R
Max EIRP Power (Rated)	82.23 dBμV/m at 3 m and 71.77 dBμV/m at 10 m
Min EIRP Power (Rated)	
Software Version	LR 16.2
Hardware Version	B66a RRH 4x45, P2
Antenna(s)	Refer to Section 3.2

The EUT supports the following carrier configurations:

Table 3.1.2 EUT Supported Configurations

Carrier Bandwidth (MHz)	Maximum No of Carriers per Path	Technology	Supported?
1.23		CDMA	
1.25		CDMA	
5	2	LTE	✓
10	2	LTE	✓
15	1	LTE	✓
20	1	LTE	✓

The operating band consists of the following blocks and spectrum:

Table 3.1.3 EUTRAN 66a, AWS Band
AWS-1 (45 MHz) [Original Equipment Grant]

Blocks	Tx Frequency (MHz)	Rx Frequency (MHz)	Bandwidth (MHz)
A	2110 - 2120	1710 - 1720	10

3.2 Antenna Information

The product does not incorporate integrated antennas.

4. REQUIRED MEASUREMENTS AND RESULTS

The EUT software has been upgraded to enable it to transmit and receive in the AWS-3 band, which is the subject of this Class II Permissive Change authorization request. Per 47CFR FCC Section 2.1033(c)(14), the following certification tests are required by Section 2.1046 through Section 2.1057. The measurements were conducted in accordance with the procedures set out in Section 2.1041.

47 CFR FCC Sections	Description of Tests	Required	Notes
2.1046	RF Power Output	Yes	
2.1047	Modulation Characteristics	Yes	
2.1049, 27.53(h)	(a) Occupied Bandwidth (b) Out-of-Band Emissions	Yes	
2.1051, 27.53(h)	Spurious Emissions at Antenna Terminals	Yes	
2.1053, 27.53(h)	Field Strength of Spurious Radiation	Yes	
2.1055, 27.54	Measurement of Frequency Stability	No	Same As Original Equipment Filing

4.1 Section 2.1046 MEASUREMENT REQUIRED: RF POWER OUTPUT

This test is a measurement of the total RF power level transmitted at the antenna-transmitting terminal, as shown in the accompanying test set-up diagram. The radio was tuned to a channel which is transmitting continuously in its operating frequency band. The power level of the base station was calibrated to allow the base station to operate at the manufacturer's maximum rated mean power level, i.e., ± 1 dBm (1.25 mW) per LTE carrier at the antenna-transmitting terminal.

4.1.1 RF Power Output Measurement

Power measurements were conducted with a broadband Power Meter in the average mode per KDB 971168 D01. Before the testing was started, the Base Station was given a sufficient "warm-up" period as required.

The maximum rated mean power per single carrier and per dual carrier, were measured at the antenna transmitting terminal for each carrier bandwidth (5, 10, 15 & 20 MHz) with QPSK, 16QAM and 64QAM modulation across the entire AWS-3 operating frequency band, respectively. The maximum rated mean RF power outputs of the EUT measured are given in Table 4.1.1. The RF power output measured for each configuration was also shown as "Ref Lvl" in the plots provided in Sections 4.3 and 4.4.

**Table 4.1.1 The Maximum Average RF Output Power of the EUT- Measured
Single Carrier per Antenna Port**

Transmit Configuration	Measurement Configuration	Maximum Average RF Output Power		Maximum Derivation
		Watts	dBm	dB
2xMIMO	BW 5 MHz	40	46.02	$\leq \pm 1$
2xMIMO	BW 10, 15, 20 MHz	90	49.54	
4xMIMO	BW 5 MHz	20	43.01	
4xMIMO	BW 10, 15, 20 MHz	45	46.53	$\leq \pm 1$

4.1.1.1 RF Power Output Results:

The maximum mean RF power outputs of the EUT measured at its antenna transmitting terminals were measured in full compliance with the Rules of the Commission and are listed above.

4.1.2 Peak-to-Average Power Ratio Measurement:

The Peak-to-Average Power Ratio (PAPR) of the EUT has also been measured per KDB 971168 D01 procedures for 5 MHz, 10 MHz, 15 MHz and 20 MHz carriers at the lowest settable and the highest settable channels of the AWS-3 operating band, with QPSK+16QAM and 64QAM, respectively. Measurements were made for both single and dual carriers at Tx1 & Tx2 for 2T4R operation and at Tx3 & Tx4 for 4T4R operation. The PAPR values (0.1% probability) of the EUT measured are all below 13dB. The maximum PAPR value measured is given in Table 4.1.2 and the plot below.

In order to keep this report to a manageable size, it is sufficient to display only the single carrier configurations for PAPR results.

**Table 4.1.2 The Maximum PAPR Value at 0.1% probability of the EUT
Lowest and Highest Settable Carriers/Fundamentals for QPSK+16QAM and 64QAM Test Modulations**

2T4R MIMO Operation AWS-3

BW MHz	Ant. Term.	Freq MHz	Power 2T	Configuration Modulation	Maximum PAPR Value at 0.1% probability (dB)
5	Tx1	2157.5	40W	QPSK + 16QAM	< 8dB
5	Tx1	2177.5	40W	64QAM	< 8dB
10	Tx1	2160	90W	QPSK + 16QAM	< 8dB
10	Tx1	2175	90W	64QAM	< 8dB
15	Tx2	2162.5	90W	QPSK + 16QAM	≤ 8dB
15	Tx2	2172.5	90W	64QAM	≤ 8dB
20	Tx2	2165	90W	QPSK + 16QAM	< 8dB
20	Tx2	2170	90W	64QAM	≤ 8dB

4T4R MIMO Operation AWS-3

BW MHz	Ant. Term.	Freq MHz	Power 4T	Configuration Modulation	Maximum PAPR Value at 0.1% probability (dB)
5	Tx3	2157.5	20W	QPSK + 16QAM	< 8dB
5	Tx3	2177.5	20W	64QAM	< 8dB
10	Tx3	2160	45W	QPSK + 16QAM	< 10dB
10	Tx3	2175	45W	64QAM	≤ 9dB
15	Tx4	2162.5	45W	QPSK + 16QAM	< 10dB
15	Tx4	2172.5	45W	64QAM	< 10dB
20	Tx4	2165	45W	QPSK + 16QAM	< 10dB
20	Tx4	2170	45W	64QAM	< 10dB

4.1.2.1 Peak-to-Average Power Ratio Results:

The maximum Peak-to-Average Power Ratio (PAPR) of the EUT measured at its antenna transmitting terminals were measured to be in full compliance with the ≤13 dB Rules of the Commission and are listed above.

As stated in KDB 971168 D01 *Power Meas License Digital Systems v02r02*, the peak power of a digitally-modulated signal is predictable only on a statistical basis. Thus, for these types of signals, a statistical measurement of the peak power is necessary. The power complementary cumulative distribution function (CCDF) curves provide a means for characterizing the power peaks of a digitally modulated signal on a statistical basis. A CCDF curve depicts the probability of the peak signal amplitude exceeding the average power level. Most contemporary measurement instrumentation include the capability to produce CCDF curves for an input signal provided that the instrument's resolution bandwidth can be set wide enough to accommodate the entire input signal bandwidth.

Plots of the CCDF curves are shown in the following **Fig. 4.1.2**

**Figure 4.1.1 Test Set-Up for Measurement of
Radio Frequency Power Output**

4.2 Section 2.1047 MEASUREMENT REQUIRED: MODULATION CHARACTERIST

The EUT supports LTE technology only. The LTE utilizes Orthogonal Frequency Division Multiplexing (OFDM) which splits the carrier frequency bandwidth into many small subcarriers. Each individual subcarrier is modulated with QPSK, 16QAM and 64QAM digital modulation formats.

In QPSK, there are 4 possible symbol states and each symbol carries 2 bits of information. In 16QAM, there are 16 possible symbol states and each 16-QAM symbol carries 4 bits of information. While in 64QAM, there are 64 possible symbol states and each 64-QAM symbol carries 6 bits of information. Higher-order modulation, where the constellations become more dense, is more sensitive to poor channel conditions than the lower-order modulation.

The modulation characteristics measurement of LTE carriers measures the difference between the ideal symbols and the measured symbols after the equalization. The measurement was performed for QPSK, 16QAM and 64QAM, respectively, where the carrier power level was adjusted to the maximum rated mean power at the antenna terminal.

4.2.1 Modulation Characteristics Measurement

The measurements were performed at the antenna transmitting terminal of the base station system with a signal analyzer, which was calibrated in accordance with ISO 9001 process. The test set-up diagram is given in the Figure 4.2.1, where the signal analyzer used the external signals from the base station as its trigger source and time reference. Figures 4.2.2, 4.2.3, 4.2.4 and 4.2.5 show representative screen plots of the modulation measurement for 5 MHz, 10 MHz, 15 MHz and 20 MHz LTE carriers, respectively, in QPSK+16QAM combined and 64QAM modulations.

4.2.1.1 Modulation Measurements Results:

The modulation characteristics of the EUT measured are in full compliance with the Rules of the Commission. Since these measurements are repetitive, it is sufficient to display only the higher power 2T4R measurements.

4.3 Section 2.1049 MEASUREMENT REQUIRED: OCCUPIED BANDWIDTH AND OUT-OF-BAND EMISSIONS

This test measures the Occupied Bandwidth of the transmitting carrier and the Out-of-Band Emissions in the frequency spectrum immediately outside and adjacent to the transmitting carrier(s).

The occupied bandwidth (OBW) is usually defined either as the 99% power OBW or a relative OBW. The 99% OBW is the frequency bandwidth such that, below its lower and above its upper frequency limits, the mean powers radiated or conducted are each equal to 0.5 percent of the total mean power radiated or conducted by a given emission. The relative OBW is defined as the width of the signal between two points, one below the carrier center frequency and one above the carrier center frequency, outside of which all emissions are attenuated by at least X dB below the transmitter power, where the value of X is typically specified as 26.

Per KDB 971168 D01 v02r02, the relative OBW must be measured and reported when it is specified in the applicable rule part; otherwise, the 99% OBW shall be measured and reported. The OBW shall be measured when modulated by an input signal such that its amplitude and symbol rate represent the maximum rated conditions under which the equipment is operated.

4.3.1 Measurement of Occupied Bandwidth

The operating blocks and carrier configurations supported are provided in Section 3.1 Product Descriptions. The EUT transmitting band for wireless communication is governed by the FCC rules in CFR 47, Part 27, Subpart C. The minimum emission requirements and the setting of measurement equipment for the out-of-band emissions measurement of carriers were specified in FCC Part 27.53(h). The FCC's requirements are tabulated in the following table:

Table 4.3.1 FCC Part 27.53(h) Transmitter Unwanted Emission Limits

Frequency	Required Minimum Attenuation below the Mean Carrier Power P	Measurement Resolution Bandwidth (RBW)** of Spectrum Analyzer
1MHz Bands Immediately Outside the Transmitting Frequency Band	$(43 + 10 \log P \text{ watts}) \text{ dBc} = -13\text{dBm}^*$	30 kHz for BW 5 MHz 100kHz for BW 10MHz 100kHz for BW 15MHz 100kHz for BW 20MHz
Outside the above Frequency Range	$(43 + 10 \log P \text{ watts}) \text{ dBc} = -13\text{dBm}^*$	1MHz

*For Nx MIMO, the limit is reduced by $10 \cdot \log(N)$ dB.

** 3GPP TS 36.104, Table 6.6.3.3-2: Additional operating band unwanted emission limits for E-UTRA bands >1GHz

The above requirement was used as the required emission limit mask in the out-of-band emissions measurement. The occupied bandwidth and out-of-band emissions measurements were made at the antenna transmitting terminal for QPSK+16QAM and 64QAM modulations, respectively. The appropriate E-UTRA test model specified in 3GPP TS 36.141 and TS 36.104 was used for LTE carriers.

The measurements were performed with a spectrum analyzer, consistent with ANSI C63.26. The test set-up diagram is same as the one shown in the Figure 4.3.1.

The 99% occupied bandwidth measurement of an LTE carrier was measured per FCC KDB 971168, using an Agilent Technologies N9020A MXA Signal Analyzer. For the out-of-band emissions measurement, the spectrum analyzer is normally set with a resolution bandwidth which is equal to at least 1% of carrier bandwidth [Part 27.53 (h) (1), (3)] and a video bandwidth which is equal to at least 3xRBW as shown in the plots of the occupied bandwidth measurement attached in the following pages. The emissions outside the above spans were evaluated in Measurement Required: Out-of-Block Spurious Conducted Emissions. The top of the carrier measured with a resolution bandwidth which is equal to 1% of carrier bandwidth was 20 dB below the LTE carrier power measured with a resolution bandwidth greater than the carrier bandwidth (if available) or a wideband power meter. This 20dB offset was due to the fact that $10 \log (BW/1\% * BW) = 20$ dB. The RMS average detector was used in all above measurements. The measurement met the requirements of ANSI C63.26 paragraphs 5.2.4.4.1 and 5.7 which requires that the number of points in the sweep be $> 2 \times \text{Span/RBW}$.

The B66a RRH 4x45W operates either with a single carrier set to bandwidths (BW) of 5 MHz, 10 MHz, 15 MHz or 20 MHz, at either the 2x90W MIMO or 4x45W MIMO power levels as previously cited. It can also operate in dual carrier mode with any combination of bandwidths (BW): 5+5, 5+10, 5+15, 5+20, 10+15, 10+20, 15+20 and 10+10. Measurements for single carriers were made at the lowest settable and highest settable carrier frequencies for the AWS-3 (2155 – 2180 MHz) frequency band (Blocks G, H, I & J). To keep this test report to a manageable size, it is sufficient to display plots for the lowest settable and highest settable carriers for all four bandwidths, which is representative of the product.

The emission masks and measurement resolution bandwidths (RBW) were consistent with 3GPP TS 36.104 Table 6.6.3.3-2. The out-of-band emissions were measured using Total Integrated Laboratory Environment (TILE) EMI test software, by ETS-Lindgren. The carrier configurations displayed are tabulated below.

Table 4.3.2 Channels Tested for Occupied Bandwidth and Out-of-Band

Single Carrier at Max Power
AWS-3 (2155 – 2180 MHz) Only
 $2T = 10 \log 2 = 3.01 \text{ dB}$

Test Number	BW	Block	DL Carrier Frequency	DL Earfcn	Max Power 2T	Modulation	99% Power OBW

4.3.1.1 Mask Parameters

§27.53 (h) AWS Emission Limits

(1) *General protection levels.* Except as otherwise specified below, for operations in the 1695-1710 MHz, 1710-1755 MHz, 1755-1780 MHz, 1915-1920 MHz, 1995-2000 MHz, 2000-2020 MHz, 2110-2155 MHz, 2155-2180 MHz, and 2180-2200 bands, the power of any emission outside a licensee's frequency block shall be attenuated below the transmitter power (P) in watts by at least $43 + 10 \log_{10} (P)$ dB.

(3) *Measurement procedure.* (i) Compliance with this provision is based on the use of measurement instrumentation employing a resolution bandwidth of 1 megahertz or greater. However, in the 1 megahertz bands immediately outside and adjacent to the licensee's frequency block, a resolution bandwidth of at least one percent of the emission bandwidth of the fundamental emission of the transmitter may be employed. The emission bandwidth is defined as the width of the signal between two points, one below the carrier center frequency and one above the carrier center frequency, outside of which all emissions are attenuated at least 26 dB below the transmitter power.

Results:

The widest occupied bandwidth plots for each single carrier configuration, with QPSK+16QAM and 64 QAM test modulations, is displayed below. The results are tabulated above.

Out-of-Band Emission Mask Compliance

The emission mask limits are defined by:

For the 1 MHz spectrum immediately adjacent to the upper and lower edge of the measurement block/band:

$$P \text{ dBm} - [43 + 10 \log P W] - 10 \log (\text{Meas RBW}/1\% \text{ BW}) - 10 \log N$$

For greater than 1 MHz from the upper and lower edge of the measurement block/band:

$$P \text{ dBm} - [43 + 10 \log P W] - 10 \log (\text{Meas RBW}/1 \text{ MHz}) - 10 \log N$$

Where N = the number of transmit antenna terminals/ports.

The carriers are offset from the top of the emission mask by:

$$P \text{ dBm} - 10 \log (\text{Meas RBW}/ \text{BW})$$

The data plots that follow show compliance for all four carrier bandwidths, both single and dual. From the out-of-band emissions plots attached below, it can be seen that all the emissions are under the required FCC emission masks for both 2xMIMO (2T4R) and 4xMIMO (4T4R) operation, i.e., the mask is not cut. Plots are displayed for both single and dual carrier operation, with the single carriers positioned at the lowest settable and highest settable AWS-3 frequencies.

4.4 Section 2.1051 MEASUREMENT REQUIRED: SPURIOUS EMISSIONS AT THE ANTENNA TERMINALS

This test measures the emissions of spurious signals which may come from harmonic, parasitic, intermodulation and frequency conversion products and are outside the necessary bandwidth but exclude out-of-band emissions. The out-of-block spurious emissions at the antenna transmitting terminal were investigated from 10 MHz to the 10th harmonic of the carrier, per Section 2.1057(a)(1). The emission limit is as previously stated in Part 27.53(h), as :

For greater than 1 MHz from the upper and lower edge of the measurement block/band:

$$P \text{ dBm} - [43 + 10 \log P \text{ W}] - 10 \log (\text{Meas RBW}/1 \text{ MHz}) - 10 \log N$$

Where, Meas RBW = 1 MHz and N = 2 for 2T4R and 4 for 4T4R

The measurement configurations and carrier setup were same as in Section 4.3. The out-of-band emissions were measured using Total Integrated Laboratory Environment (TILE) EMI test software, by ETS-Lindgren.

The emission limits and the setting of measurement equipment for the unwanted emissions measurement were given in Table 4.3.3 and provided in Table 4.4.1, where per FCC CFR 47, Sections 2.1051 and 2.1057(c), **the spurious emissions attenuated more than 20 dB below the permissible value need not be reported.**

Table 4.4.1 Conducted Spurious Emissions Limit

Frequency of Emission (MHz)	MIMO Configuration	Required Limit (dBm)	Reportable Limit (dBm)	Detector/RBW
10-22,000	2x90 MIMO	-16	-36	Average/1MHz
10-22,000	4x45 MIMO	-19		Average/1MHz

The measurements were performed with a spectrum analyzer, which was calibrated in accordance with the ISO 9001 process. The carrier power level at the antenna transmitting terminal was calibrated before the conducted spurious emissions testing for each test. The spectrum analyzer was set to a 1MHz resolution bandwidth. The RMS average detector was used. The measurement met the requirements in ANSI C63.26 which requires in 5.2.4.4.1 and 5.7 that the number of points in the sweep be $> 2 \times \text{Span}/\text{RBW}$.

The spurious emissions in the frequency range measured are well under the required reportable emission limit for all carrier bandwidths with QPSK+16QAM and 64QAM modulations evaluated. **Therefore, there are no reportable emissions.**

4.4.1 Results:

Over the required frequency spectrum investigated for the EUT, no reportable out-of-block spurious emissions were detected. The out-of-block spurious emissions in the entire spectrum investigated are under the required reportable emission limit. The measurement results demonstrate that the subject of the application is in full compliance with the Rules of the Commission. **There are no reportable emissions.**

4.5 Section 2.1055 MEASUREMENT REQUIRED: FREQUENCY STABILITY

This measurement evaluates the frequency difference between the actual transmit carrier frequency and the specified transmit frequency assignment. Only the portion of the transmitter system containing the frequency determining and stabilizing circuitry need be put in an environmental chamber and subjected to the temperature variation test per FCC Section 2.1055. The unit which provides baseband signals, such as BBU (baseband unit), can be located outside the chamber if it is a separated unit.

This Class II Permissive Change was software only. No changes were made to the frequency determining and stabilization circuitry. There is no change from the Original Equipment authorization. **Therefore, it was not necessary to repeat this test.**

4.6 Section 2.1053 MEASUREMENT REQUIRED: FIELD STRENGTH OF SPURIOUS RADIATION

This measurement evaluates the spurious emissions that may be radiated directly from the EUT cabinet, circuits or power leads under normal conditions of installation and operation. The EUT shall be investigated from 30 MHz to the 10th harmonic of the carrier, per Section 2.1057(a)(1).

The EUT was set to transmit in the 2155 - 2180 MHz frequency band with LTE technology and 2x90W MIMO. It was configured as in the normal mode of the installation and operation with the maximum power output per Table 4.6.1. The test model used for configuring the LTE carrier was described in Section 4.3. All carriers were transmitting to non-radiating 50 Ω resistive loads.

Table 4.6.1 EUT Configuration – Dual Carrier – 2x90W MIMO

Config No	No of Carriers/Port	Tx1 (freq)	Tx2 (freq)	Power/c (dBm)	Carrier BW (MHz)	Modulations
1	2	2160 + 2175 MHz	2160 + 2175 MHz	46.53	10 + 10	(QPSK+16QAM) + 64QAM

The emission limits and the setting of measurement equipment for the spurious emissions measurement were given in Section 4.3. FCC sections 2.1051 and 2.1057(c) specify that the spurious emissions attenuated more than 20 dB below the permissible value need not be reported. By using the relation between the electric field strength of an ideal dipole and its excitation power given in Reference Data for Radio Engineers, page 676, 4th edition, ITT Corp., the emission limit calculated for electric field strength and its reportable limit equal.

The equipment under test (EUT) was configured as recommended for *floor standing equipment*, following the guidelines of ANSI C63.4-2009. The EUT was installed and operated as in the *normal mode of operation*. Field strength measurements of radiated spurious emissions were evaluated in a 3m semi-anechoic chamber, using an EUT-to-Antenna separation of 3-meters. Test software was Vasona by EMIsoft.

Measurements were made using both horizontally and vertically polarized broadband antennas. Per FCC regulations, the comparison of out of band spurious emissions directly to the limit is appropriately made using the substitution method. However, *when the emissions are more than 20 dB below the specification limit*, the use of field strength measurements for compliance determination is acceptable and those emissions are considered *not reportable* (Section 2.1057 and the FCC Interpretive database for 2.1053).

For this case the evaluation of acceptable radiated field strength is as follows. The calculated emission levels were found by:

$$\begin{aligned} &P_{\text{meas}} (\text{dBm}) + \text{Cable Loss}(\text{dB}) + \text{Antenna Factor}(\text{dB}) + 107 (\text{dB}\mu\text{V}/\text{dBm}) - \text{Amplifier Gain} (\text{dB}) \\ &= \text{Field Strength} (\text{dB}\mu\text{V}/\text{m}) \end{aligned}$$

Section 27.53 and 2.1053 contains the requirements for the levels of spurious radiation as a function of the EIRP of the unmodulated carrier. The reference level for the unmodulated carrier is calculated as the field produced by an isotropic radiator excited by the transmitter output power according to the following relation taken from Reference Data for Radio Engineers, page 27-7, 6th edition, IT&T Corp.

$$E = (120\pi P)^{1/2} = [(30 * P)^{1/2}] / R$$

$$20 \log (E \cdot 10^6) - (43 + 10 \log P) = 82.23 \text{ dB } \mu\text{V/meter}$$

Where: E = Field Intensity in Volts/ meter R = Distance in meters = 3 m
P = Transmitted Power in watts = 180 W (2x90w MIMO)

Table 4.6.2 Calculated Radiated Spurious Emission Limit in Electrical Field Strength

Frequency Range (MHz)	Measurement Distance (m)	Required E Limit (2x2 MIMO) (dBμV/m)	Reportable E Limit (dBμV/m)	Detector/RBW
10-22,000	3	82.23	62.23	Average/1MHz

The field strength of radiated spurious emissions measured was determined by

$$E(\text{dB}\mu\text{V/m}) = V_{\text{meas}}(\text{dB}\mu\text{V}) + \text{Cable Loss (dB)} + \text{Antenna Factor (dBi/m)}$$

Field strength measurements of radiated spurious emissions were made in a semi-anechoic room of Global Product Compliance Laboratories of Alcatel-Lucent Murray Hill which was detailed in Section 6. The recommendations of ANSI C63.4 and ANSI C63.26 were followed for EUT testing setup, cabling, and measurement approach and procedures. All the measurement equipment used, including antennas, was calibrated in accordance with ISO 9001 process. The EUT setup diagram is given in the Figure 4.6.1. **The minimum margin measured per Table 4.6.2 is more than 20dB below the required limit.**

4.6.1 Field Strength of Radiated Emissions Results:

Over the frequency spectrum investigated no reportable radiated spurious emissions were detected. The smallest passing margin was 382.999 MHz at 27.97 dB μ V/meter, which is 54 dB below the limit, **and is not reportable**. The measurement results of the EUT, subject of this application, demonstrate the full compliance with the Rules of the Commission.

4.8 FACILITIES AND ACCREDITATION

All measurement facilities at Alcatel-Lucent Global Product Compliance Laboratory (GPCL) used to collect the measurement data in the test report are located at 600-700 Mountain Avenue, Murray Hill, New Jersey 07974-0636 USA.

The field strength measurements of radiated spurious emissions are made in a FCC and IC registered three meter semi-anechoic chamber AR4 (FCC Site Registration Number: 647637, IC Filing Number: 6933F-7) which is maintained by Alcatel-Lucent in Murray Hill, New Jersey. The sites were constructed and are continuously in conformance with the requirements of ANSI C63.4 and CISPR Publication 22.

Alcatel-Lucent Global Product Compliance Laboratory is accredited with the US Department of Commerce National Institute of Standards and Technology's National Voluntary Laboratory Accreditation Program (NVLAP) for satisfactory compliance with criteria established in Title 15, Part 7 Code of Federal Regulations for offering test services for selected test methods in Electromagnetic Compatibility; Voluntary Control Council for Interference (VCCI), Japan; Australian Communications and Media Authority (ACMA). The laboratory is ISO 9001:2008 Certified.

United States Department of Commerce
National Institute of Standards and Technology

Certificate of Accreditation to ISO/IEC 17025:2005

NVLAP LAB CODE: 100275-0

Nokia, Global Product Compliance Lab
Murray Hill, NJ

*is accredited by the National Voluntary Laboratory Accreditation Program for specific services,
listed on the Scope of Accreditation, for:*

Electromagnetic Compatibility & Telecommunications

*This laboratory is accredited in accordance with the recognized International Standard ISO/IEC 17025:2005.
This accreditation demonstrates technical competence for a defined scope and the operation of a laboratory quality
management system (refer to joint ISO-ILAC-IAF Communique dated January 2009).*
