TUNE-UP PROCEDURE

2.1033

(9) Tune-up Procedure

All the necessary adjustments will be set in the factory, and no adjustments are needed. The output power level will have its 25 mW limit defined during the factory calibration and will not operate outside of this limit. The operating output power is remotely controlled by the Cellular Radio Exchange (CRE). If the Transceiver (TRX) is not able to maintain the requirements for power output, frequency stability, etc., a fault code is sent to the CRE. On severe faults the TRX will disable transmission.
