*Corporate Juridical Person***ENGINEERING TEST REPORT****REPORT NO. A-031-98-C**

Issued Date : October 16, 1998

This test report is to certify that the tested device properly complies with the requirements of:

FCC Rules and Regulations Part 95 ; Radio Control(R/C) Radio Service.

The tests necessary to show compliance to the requirements were performed and these results met the specifications of requirement. The results of this report should not be construed to imply compliance of equipment other than that which was tested. Unless the laboratory permission, this report should not be copied in part.

1. Applicant

Company Name : SANWA ELECTRONIC INSTRUMENT CO., LTD.
Mailing Address : 1-2-50 HONMACHI YOSHIDA HIGASHIOSAKA CITY 578-0982 JAPAN

2. Identification of Tested Device

FCC ID : AXYATX029
Device Name : Radio Control Transmitter
Trade Name : AIRTRONICS
Model Number : RD6000
Serial Number : Prototype No.1 : ☐ Prototype ☒ Pre-production ☐ Production
Date of Manufacture : September, 1998

3. Test Items and Procedure

- ☒ Measurement of RF Power Output (Substitution Method)
- ☒ Modulation Characteristics
- ☒ Emission Bandwidth
- ☒ Measurement of Field Strength of Spurious Radiation
- ☒ Frequency Stability Measurement

Above all tests were performed under : FCC Part 2 Section 2.985, Section 2.987, Section 2.989, Section 2.993 and Section 2.995

4. Date

Receipt of Test Sample : September 2, 1998
Test Completed on : October 9, 1998

CERTIFIED BY :

Seiichi Izumi
Manager of Ikoma Testing Laboratory

ENGINEERING TEST REPORT**1. GENERAL INFORMATION****1.1 Product Description**

The Model No.RD6000(referred as EUT in this report) is the radio control(R/C) transmitter.

1)Technical Specifications

Transmitting Frequency : 72.79 MHz in EUT
Emission Designator : F1D

2) Contained Oscillator

6th OVER-TONE : 12.1316 MHz

3) Modulation Mode

- (1) PC1 : MIN Cycle 400 μ SEC PCM MODULATION.
- (2) PC2 : MIN Cycle 800 μ SEC PCM MODULATION.
- (3) PP : MIN Cycle 1300 μ SEC PPM MODULATION.
- (4) PPR : Reversed signal phase of ITEM 3, PPM MODULATION.

4) Rated Power Supply : DC 9.6 V (Ni-Cd battery)

1.2 Description for Equipment Authorization**1) Rules Part(s) under which Equipment operated**

FCC Rule Part 95 ; Radio Control(R/C) Radio Service

2) Kind of Equipment Authorization

(x) Type Acceptance () Certification () Verification

3) Procedure of Application

(x) Original Equipment () Modification

1.3 Test Facility

Name : KANSAI ELECTRONIC INDUSTRY DEVELOPMENT CENTER (KEC)
IKOMA TESTING LABORATORY
Open Test Site No.1

Address : 10630, Takayama-cho Ikoma-city, Nara, 630-0101 Japan

This test facility has been filed in FCC under the criteria in ANSI C63.4-1992.
The laboratory has been accredited by the NVLAP (Lab.Code:200207-0) based on
ISO/IEC Guide 25.

ENGINEERING TEST REPORT**2. TESTED SYSTEM****2.1 Test Mode**

The compliance tests were performed under the following operation mode.

Measurement of Field Strength of Spurious Radiation :

The EUT was continuously transmitted in modulation mode of PP.

Frequency Stability Measurement :

The EUT was continuously transmitted in the following two non-modulation mode.

1) F-Low

2) F-High

Except above two test items :

See the page of each test items.

2.2 Block Diagram of EUT System

[Note]

See 2.3 List of EUT System and 2.4 List of Antenna.

ENGINEERING TEST REPORT

2.3 List of EUT System

No	Device Name	Model Number (Serial Number)	FCC ID (Trade Name)	Note	Remark

[Remark]

1) : Accessory of EUT

ENGINEERING TEST REPORT

3. RF POWER OUTPUT

3.1 Reference Rule and Specification

FCC Rule Part 95 [§95.639] and Part 2 Subpart J [§2.985]

3.2 Test Configuration

[Open Site]

3.3 Test Procedure

- 1) Tune-up the transmitter.
- 2) The receiving antenna is adjusted to the correct length for the carrier frequency.
- 3) Raise and lower the receiving antenna to obtain a maximum reading on the Spectrum Analyzer with the antenna at horizontal polarity. Then the turntable is rotated to further increase this maximum reading. Repeat this procedure of raising and lower the antenna and rotating the turntable until the highest possible signal has been obtain.
Record this maximum reading.
- 4) Repeat step3 with the antenna polarized vertically.
- 5) Remove the transmitter and replace it with the half-wave antenna. The center of these antennas are approximately at the same location as the center of the transmitter.
- 6) Feed the half-wave antenna at the transmitter end with a signal generator connected to the antenna by means of a non-radiating cable.
With the antennas at both ends horizontally polarized and with the signal generator tuned to the carrier frequency, raise and lower the receiver antenna to obtain a maximum reading at the Spectrum Analyzer. Adjust the level of the signal generator output until the previous recording maximum reading for this set of conditions its obtained.
- 7) Repeat step6 with both antennas vertically polarized.

ENGINEERING TEST REPORT

3.4 Test Result

CARRIER FREQUENCY [MHz]	SPECTRUM ANALYZER READING [dB μ V]		RF METER READING [dBm]		CABLE LOSS [dB]	RF OUTPUT POWER [mW]	LIMIT [mW]
	Horiz.	Vert.	Horiz.	Vert.			
72.79	113.8	109.4	23.0	24.1	0.3	239.9	750

The RF Power Output can be calculated from following formula:

$$\text{RF Power (mW)} = 10^{(\text{Mr} - \text{Lo}) \div 10}$$

where,

Mr: RF Meter Reading (dBm)

Lo: Loss of Cable (dB)

[Environment]

Temperature : 26 °C Humidity : 48 %

[Summary of Test Results]

Above data shows that the test device complies with the requirements.
Minimum margin was 5.0 dB, vertical polarization.

Tested Date : September 30, 1998

5.2 Test Configuration

ENGINEERING TEST REPORT**5.3 Test Result**

See next figure (the picture of spectrum analyzer)

Occupied Bandwidth

I measured by the spectrum analyzer TR4172 which could measure 99% occupied bandwidth(OBW).

There are 1001 data on horizontal axe of display.

One of them is V_n . Then all power P becomes following fomula.

$$P = \sum_{n=1}^{1001} \frac{V_n^2}{R} \quad \text{-----} \quad (1)$$

where, R is input impedance of TR4172.

If, at number X points from the left edge of display, sum of power becomes 0.5% of P and at number Y points, sum of power become 99.5% of P ,

$$0.005 P = \sum_{n=1}^X \frac{V_n^2}{R} \quad \text{-----} \quad (2)$$

$$0.995 P = \sum_{n=1}^Y \frac{V_n^2}{R} \quad \text{-----} \quad (3)$$

From(1)~(3), OBW becomes next.

$$O B W = \frac{f_{SPAN}(Y - X)}{1000}$$

where, F_{SPAN} is frequency span of the spectrum analyzer.

ENGINEERING TEST REPORT**6. FIELD STRENGTH OF SPURIOUS RADIATION****6.1 Reference Rule and Specification**

FCC Rule Part 95 [§ 95.635] and Part 2 Subpart J [§ 2.993]

6.2 Test Procedure

- 1) Tune-up the transmitter(EUT).
- 2) Device Vertical : Place the device so that it's longest axis is vertical.
- 3) For each spurious measurement the receiving antenna is adjusted to the correct length for the frequency involved. These measurements are made from the lowest radio frequency generated in the EUT or 25MHz to the tenth harmonic of the carrier.
- 4) For each spurious frequency, raise and lower the receiving antenna to obtain a maximum reading on the spectrum analyzer with the antenna at horizontal polarity. Then the turntable is rotated to further increase this maximum reading. Repeat this procedure of raising and lower the antenna and rotating the turntable until highest possible signal has been obtain. Record this maximum reading.
- 5) Repeat Step4 for each spurious frequency with the antennae polarized vertically.
- 6) Device Horizontal : Place the device so that it's longest axis is horizontal.
- 7) Repeat Step3, Step4, and Step5
- 8) The attenuation of the spurious in dB can be calculated from the following formula:

$$\text{Spurious Attenuation [dB]} = \text{Field Strength of Carrier Emission [dB}\mu\text{V/m]} - \text{Field Strength of Spurious Emission [dB}\mu\text{V/m]}$$

ENGINEERING TEST REPORT**6.3 Test Configuration**
