Product Description: Garage Door Transmitter

Marketing Approval                     

Description of non-standard test method or test practice: *None*

Estimated Measurement Uncertainty: *Not Applicable*

Special limitations of use: *None*

Traceability: *reference standards of measurement have been calibrated by a competent body using standards traceable to the NIST.*

According to testing performed at Product Safety Engineering, Inc., the above-mentioned unit is in compliance with the electromagnetic compatibility requirements defined in regulations indicated on page (3) of the test report. The test results contained herein relate only to the model(s) identified above. It is the manufacturer's responsibility to assure that additional production units of this model are manufactured with identical electrical and mechanical characteristics.

As the responsible EMC Project Engineer, I hereby declare that the equipment tested as specified above conforms to the requirements indicated on page (3) of the test report.

## GENERAL REMARKS:

The (20) dB bandwidth is (381) kHz. This meets the requirement of being less than (0.25%) of the center frequency. Center frequency = (360) MHz. The maximum allowable bandwidth at (360) MHz is (900) kHz.

We made measurements up to the tenth harmonic.

The EUT was evaluated in (3) orthogonal orientations and the worst case data is reflected in the test report.

## SUMMARY:

The requirements according to the technical regulations are

■ - met

□ - **not** met.

The device under test does

■ - fulfill the general approval requirements mentioned on page 3.

□ - **not** fulfill the general approval requirements mentioned on page 3.

### **Measurement Protocol**

The test methodology followed during the collection of the data included within this technical report was ANSI C63.4:1992.

The EUT was powered with 9 Volts DC during the collection of data included within.

The data is compared to the FCC Part 15 limits.

The "EMI" instrumentation is capable of calculating the final emission level based on the following formula:

Level at the receiver (dB $\mu$ V) + Antenna Correction Factor (dB/M) + Cable Loss (dB) - Preamp Gain (dB) = Actual Level in dB $\mu$ V/M.

The sample calculation below is based on the actual test data collected:

|                |   |             |              |             |
|----------------|---|-------------|--------------|-------------|
| Observed Level |   | <b>91.4</b> | dB $\mu$ V   |             |
| ACF            | + | <b>15.0</b> | dB/M         |             |
| Cable Loss     | + | <b>0.6</b>  | dB           |             |
|                |   | <b>6</b>    |              |             |
| Preamp Gain    | - | <b>26.0</b> | dB           |             |
| Actual Level   |   | <b>81.0</b> | dB $\mu$ V/M | @ 360.0 MHz |
