6. Remarks and comments

1. The tested configurations were selected based on the worst-case spurious emissions per frequency band from modular type approval report.
3. The DUT has different two antenna manufacturers (WNC and HongBo) but the WWAN module and the rated output power remain the same. For each band, tests were performed on the highest peak antenna gain
4. In regard of RSS 197 annex C shows a description of the algorithm implementation for both reducing the EIRP the limit allowed and decoding an enabling signal from the base station before the mobile equipment can transmit

7. Test Verdicts summary

Annex A. Test & System Description

A.1 Measurement System

Measurements were performed using the following setups. A communication tester was used to establish a communication link with the EUT, and the communication tester parameters were set to get the maximum output power from the EUT.

Radiated test setup

Radiated Setup 30 MHz - 1 GHz (Transmitter tests)

Radiated Setup 1 GHz – 6.4GHz (Transmitter tests)

Radiated Setup 6.4 GHz – 18 GHz (Transmitter tests)

Radiated Setup 18 GHz – 40 GHz (Transmitter tests)

Sample Calculation

The spurious received power P at the spectrum Analyzer is converted to EIRP the equivalent isotropically radiated power, in dBm using the transducer factor F corresponding to the Rx path Loss:

$$F \text{ (dB)} = \text{Free Space Attenuation (dB)} + \text{Cable losses (dB)} - \text{Amplifiers Gain (dB)} - \text{Rx Antenna Gain (dBi)}$$
$$\text{EIRP (dBm)} = P(\text{dBm}) + F \text{ (dB)}$$

B.1.2 Test procedure

The setup described in Test & System Description section was used to measure the radiated spurious emissions. Depending of the frequency range and bands being tested, different antennas and filters were used. The final measurement is done by varying the antenna height from 1 to 4 meters, the EUT azimuth over 360° and for both Vertical and Horizontal polarizations.
