

Test Report – Transmitter Conducted Spurious Emissions FCC/IC

Equipment under test (EUT):

75W PEP Base Station Transceiver Model 63030-48, S/N 63B4000101BK

Equipment Identifiers:

FCC ID: BIB63030-48

IC: 1300A-6303048

Occupied Bandwidths:

8.9 kHz, 17.8 kHz

Test Results: See data in Table 1. All spurious emissions comply with -25 dBm limit.

Test date and location:

December 6, 2012

Meteorcomm LLC, 1201 W. 7th St., Renton, WA 98057

Test Method: ANSI/TIA-603-C-2004 §2.2.13

47CFR§2.1051, RSS-Gen §4.9

Test Limits: 47CFR§90.210 Mask F. Mask F floor = -25 dBm

RSS-119 §5.8 Mask F. Mask F floor = -25 dBm.

Frequency range of spurious search:

30 MHz to 2.5 GHz, excluding frequencies within ± 61.75 kHz of the transmitter carrier frequency.

Transmitter test conditions:

Power Supply Voltage: 48 Vdc

Ambient temperature: 22°C.

Duty cycle: 100%

Eight operational variations were scanned for spuri based on permutations of the transmitter frequency limits, power limits and modulation types:

Transmitter carrier frequencies (fo): 220.0125 MHz and 221.9875 MHz

Maximum and minimum rated power: 48.75 dBm PEP, 40 dBm PEP

Modulation: DQPSK 32 kbps and DQPSK 16 kbps

Procedure:

The ANSI/TIA-603-C-2004 §2.2.13 unwanted emissions test procedure was adapted to meet specific FCC and IC search range, bandwidth and detector requirements.

Preliminary scans were conducted at broad search ranges to identify signals of interest ≥ -45 dBm, followed by close inspection of those signals at narrow search ranges.

CISPR Quasi-peak detection was used as the final detector on signals of interest where

possible below 1 GHz and average detector was used above 1 GHz. Quasi-peak detection is not available for the close-in integrated measurements.

Because test bandwidths ranged up to 1MHz and peak detection was used, radio frequency filters were inserted to suppress the carrier so that the test apparatus sensitivity could be increased adequately to identify transmitter spurs down to the reporting limit of -45 dBm, excluding close-in measurements. See the list of test parameters in the frequency search range table at the end of this exhibit for more details.

The test apparatus loss was pre-measured across the test frequency range eliminating the need for substituting a signal generator with calibrated output power.

Results:

Since Industry Canada spurious emission measurement test bandwidth requirements are more stringent than FCC requirements below 1 GHz, only Industry Canada compliant measurements are reported in Table 1. Example signal analyzer plots are shown for some of the entries in Table 1.

Please note that the internal phase noise of the signal analyzer limits the close-in measurement sensitivity of the test setup to approximately -27 dBm at ± 111.8 kHz offset from the carrier at the IC specified 100 kHz integration bandwidth.

Table 1. Unwanted Spurious Emissions. Compliance limit = -25 dBm.

Carrier Frequency, MHz	Power Output, dBm	Bit Rate, kbps	Search Range, MHz	Spur Freq MHz	Measured Level, dBm	Corrected Level, dBm	dBc	Plot Figure

Example calculation for first entry in Table 1:

Measured Amplitude (Figure 1) -22.21 dBm
 Offset correction: + 0.20 dB
 Corrected spur amplitude: -25.01 dBm

Limit: -25 dBm

Spur power -25.01 dBm
 Subtract carrier power -48.75 dBm
 Spur level -73.76 dBc

Statement of Test Supervisor:

All tests were conducted by me or under my supervision.

John F. "Fred" Cleveland, Principal Engineer

Test setup:

The test equipment list, test setup block diagram, test setup photograph and equipment calibration information is submitted in a separate exhibit.

See Table 2 for the parameters of the unwanted emission search followed by some example plots.
