LETTER OF AUTHORIZATION

1. GENERAL INFORMATION

1.1 Product Description

The TFT Model EAS911+ encodes and decodes messages in accordance with the newly established Emergency Alert System (EAS) as described in FCC Report and Order and Further Notice of Proposed Rule Making FCC 94-288 that was adopted on November 10, 1994. The TFT Model EAS911+ is self contained in a 19" wide by 5" high rack mount enclosure and is intended to allow radio, television, and cable broadcasters the ability to send the receive EAS message as required by the FCC.

3. EAS ENCODER COMPLIANCE TESTS

3.1 EAS Encoder Protocol Verification

3.1.1 Test Objective

The objective of this test is to verify encoding the EAS protocol as described in §11.31 as required in §11.32(a):

§11.32(a):

EAS Encoders must at a minimum be capable of encoding the EAS protocol described in §11.31 and providing the EAS code transmission requirements described in §11.51.

3.1.2 Test Block Diagrams

3.1.3 Test Methodology

This test consists of encoding the 10 examples FCC EAS messages by following the encoder procedure in the installation and operation manual. Verification employs the TFT Model EAS 911+ for confirmation.

Print outs of both the encoder and decoder are attached to the data sheets.

Note: This session show the sample of EAS protocol meeting 11.31(c) requirement are met. 11.31(a)&(b) define what can and what cannot be in an EAS protocol message. If 11.31(c), which shows the actual construction of a complete EAS protocol message, is proved, then 11.31(a)&(b) must be met.

Note: The test and test example #1 from page 7 thru page 10 were deleted. Therefore the test example number will be from Test example #2 to #11.

The page 7 to page 11 are intentionally omitted

3.1A EAS Protocol Verification for §11.32(a)(1)

3.1A.1 Test Objective

The objective of this test is to verify the EAS Protocol which consists of a four part message for an emergency activation of the EAS. :

§11.32(a)(1):

The Preamble and EAS Codes must use Audio Frequency Shift keying at a rate of 520.83 bits per second to transmit the codes. Mark frequency is 2083.3 Hz and space frequency is 1562.5 Hz. Mark and space time must be 1.92 milliseconds. Characters are ASCII seven bits as defined to ANSI X3.4-1977 ending with an eighth null bit (either 0 or 1) to constitute a full eight-bit byte.

3.1A.2 Test Block Diagrams

3.1A.3 Test Methodology

A Tektronix Storage Oscilloscope Model TDS2024 is used to capture all signal timing and duration. The display data are shown in the following 12 Pages.
