2210 Faraday Ave., Suite 150
Suite 150, Carlsbad, CA 92008

Attention:

EMC and Wireless Test Engineer

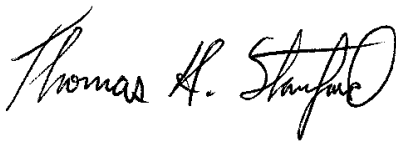

Reference: Model COM6100 Product ID label location

The product ID label is placed in the battery compartment for several reasons;

1. A label mounted on the external surface of the case is not cosmetically appealing.
2. Having the label on the external surface will get worn off over time or become illegible.
3. Over time approvals are gained in other countries and there is a need for a large label to allow room for various IDs and nomenclature. A large label on the external surface is again not cosmetically appealing.

Every unit is shipped to the end user without a battery installed for safety reasons. When received the label is always clearly visible to the user. The label is also clearly visible to the user every time they change batteries. A professional installer is always used to install the system at the user location. A system includes other components beside this mobile unit. The installer points out the location of the label to the user so that when they call for tech support they know where to look to identify the unit for the technical support person on the phone.

Best Regards,

Thomas H. Stanford
