## **1. General Remarks**

### **1.1 Complementary Materials**

There is no attachment to this test report.

## **2. Test Sites**

### **2.1 Test Facilities**

The Federal Communications Commission and Industry Canada has reviewed the technical characteristics of the test facilities at TÜV Rheinland EPS B.V., located in Leek, 9351VT Eiberkamp 10, The Netherlands, and has found these test facilities to be in compliance with the requirements of 47 CFR Part 15, section 2.948.

The description of the test facilities has been filed at the Office of the Federal Communications Commission under registration number 90828. The facility has been added to the list of laboratories performing these test services for the public on a fee basis.

The description of the test facilities has been filed to Industry Canada under registration number 2932G-2. The facility has been added to the list of laboratories performing these test services for the public on a fee basis.

Normal test conditions:

Temperature (*)	: +15°C to +35°C
Relative humidity(*)	: 20 % to 75 %
Supply voltage	: 120VAC/60Hz
Air pressure	: 950 – 1050 hPa

When it was impracticable to carry out the tests under these conditions, a note to this effect stating the ambient temperature and relative humidity during the tests are stated separately.

### **3. General Product Information**

#### **3.1 Product Function and Intended Use**

The brand Nedap model !D Top Region 2, hereafter referred to as EUT, is a Spread Spectrum Transmitter (Equipment code: DSS) intended to be used in a building access system.  
The EUT is a UHF RFID reader and is factory configured for the 902.75-927.25 MHz band.

The content of this report and measurement results have not been changed other than the way of presenting the data.

#### **3.2 System Details**

Details and an overview of the system and all of its components, as it has been tested, may be found below.

EUT	: Spread Spectrum Transmitter (equipment code: DSS)
Manufacturer	: N.V. Nederlandsche Apparatenfabriek "Nedap"
Brand	: Nedap
Model	: !D Top Region 2
Serial number	: D422 002
Voltage input rating	: 56Vdc
Voltage output rating	: --
Current input rating	: --
Antenna	: Integral antenna
Operating frequency range	: 902.75-927.25 MHz
Modulation	: GFSK
Spreading technique	: FHSS
Remarks	: n.a.

Test Report No.:

**13031902.fcc04**

Page 8 of 42

### Table 3: Interfaces present on the EUT

There is an Ethernet and an USB interface present on the EUT.  
The USB interface is for servicing purposes only.

No.	Port	From	To	Remarks
1.	Mains	Mains	Laptop (AUX1)	Through a AC/DC power supply
2.	Mains	Mains	AUX2	--
3.	DC power	AUX2	EUT	--
4.	Data com.	Laptop USB or Ethernet	EUT	--

### 3.3 Clock Frequencies

The highest clock frequency generated by the EUT is 24.000 MHz.

### 3.4 Countermeasures to achieve EMC Compliance

No additional measures were employed to achieve compliance.

## **4. Test Set-up and Operation Modes**

### **4.1 Test Methodology**

The test methodology used is based on the requirements of 47 CFR Part 15, Sections 15.31, 15.33, 15.35, 15.205, 15.207, 15.209, 15.247 and RSS-Gen and RSS-210.

The test methods, which have been used, are based on ANSI C63.10: 2009.

During pretests no significant differences were observed in test results while varying supply voltage from 85% to 115%.

For details, see under each test item.

### **4.2 Operation Modes**

Testing was performed at the lowest operating frequency (902.75), at the operating frequency in the middle of the specified frequency band (914.75 MHz) and at the highest operating frequency (927.25 MHz).

### **4.3 Physical Configuration for Testing**

The EUT was tested on a stand-alone basis and the test system was configured in a typical fashion (as a customer would normally use it).

The justification and manipulation of cables and equipment in order to simulate a worst-case behavior of the test setup has been carried out as prescribed in ANSI C63.10:2009.

**Figure 1: Test Setup Diagram**

**Notes:**

For more details, refer to the document: Test Set-Up Photographs document.

## 4.4 Test Software

The EUT was provided by the manufacturer with suitable software to allow operation in all the required modes.

Software used for testing: !D Reader Test Application.

This software was running on a laptop computer (AUX1). It was used to enable the test operation modes listed in section 4.2 as appropriate.

Test Report No.:

**13031902.fcc04**

Page 11 of 42

## 4.5 Special Accessories and Auxiliary Equipment

The product has been tested together with the following additional accessories:

1. AUX1  
Product: Laptop Computer  
Brand: HP  
Model: Compaq 610  
Serial Number: CNU94710W B  
Remark: property TR-EPS, host for testsoftware
  
2. AUX2  
Product: Power Inserter  
Brand: Power-WIN Technology Corp.  
Model: PW-085C-1Y560IPOE  
Nedap Art. Nr.: 9651772  
Serial number: PW73658385  
Voltage input rating: 100-240Vac 50-60 Hz  
Voltage output rating: 56Vdc  
Remarks: connects to EUT

Test Report No.:

**13031902.fcc04**

Page 12 of 42

## 5. Test Results

### 5.1 Conducted and Radiated Measurements

#### 5.1.1 Conducted Output Power

**RESULT: PASS**

Date of testing:

2013-06-07

Requirements:

FCC 15.247(b)(2) and RSS-210 Section A8.4 (1)

For systems using frequency hopping in the 902-928 MHz band, the maximum peak output power is 1W (+30dBm) for systems employing at least 50 hopping channels.

Test procedure:

ANSI C63.10: 2009.

The Peak Conducted Output Power was measured using the method stated in section 6.10.1 in ANSI C63.10: 2009.

The maximum peak output power (conducted) was measured at the antenna connector with a spectrum analyzer. The final measurement takes into account the loss generated by all the involved cables and the attenuator.

**Table 4: Conducted Output Power**

Frequency [MHz]	Configured Average Output Power [dBm]	Output Peak Power [dBm]	Output Peak Power [mW]	Limit [dBm]	Limit [mW]	Result
902.75	28.0	26.41	437.5	+30	1000	Pass
914.75	28.0	26.44	440.6	+30	1000	Pass
927.25	28.0	26.30	426.6	+30	1000	Pass

Notes:  $\text{mW} = 10^{(\text{dBm}/10)}$   
 $\text{dBm} = 10 \times \log(\text{mW})$

**plots : Peak power plots,**

Plots on the next pages show the Peak Power outputs, correction factors included in the reading. Offset in the plots shown is 19.5 dB, this is the total loss of attenuators and cable used.

### **5.1.2 20dB Bandwidth**

**RESULT: Pass**

Date of testing: 2013-06-07

Requirements:

FCC 15.247(a)(1)(i) and RSS-210 Section A8.1(c).

For frequency hopping systems operating in the 902–928 MHz band: if the 20 dB bandwidth of the hopping channel is less than 250 kHz, the system shall have at least have 50 hopping channels and the average time of occupancy on any frequency shall not be greater than 0.4 seconds within a 20 second period; if the 20 dB bandwidth of the hopping channel is 250 kHz or greater, the system shall use at least 25 hopping frequencies and the average time of occupancy on any frequency shall not be greater than 0.4 seconds within a 10 second period. The maximum allowed 20 dB bandwidth of the hopping channel is 500 kHz.

Test procedure:

ANSI C63.10: 2009.

A spectrum analyzer was connected to the antenna port of the EUT. The spectrum analyzer resolution bandwidth was set to 10kHz and the span between 2 – 5 times the emission bandwidth.

Offset in the plots shown is 19.5 dB, this is the total loss of attenuators and cable used.

Note: 99% bandwidth is provided for info.

### 5.1.3 Conducted Spurious Emission

**RESULT: Pass**

Date of testing: 2013-05-15

Requirements:

FCC 15.247(d) and RSS-210 Section A8.5.

In any 100kHz bandwidth outside the frequency band, the RF power shall be at least 20dB below that of the maximum in-band 100kHz emission.

Test procedure:

ANSI C63.10: 2009.

A spectrum analyzer was connected to the antenna port of the EUT. The analyzer resolution bandwidth was set to 100kHz. For each channel investigated, the in-band and out-of-band emission measurements were performed. The out-of-band emissions were measured from 30MHz to 10GHz (10<sup>th</sup> harmonics).

The final measurement takes into account the loss generated by all the involved cables. Offset in the plots shown is 20.5 dB, this is the total loss of attenuators and cable used.

## **5.1.4 Band Edge Conducted Emissions**

**RESULT: Pass**

Date of testing:

2013-05-15

Requirements:

FCC 15.205, FCC 15.209, FCC 15.247(d) and RSS-210 section A8.5.

In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement, provided the transmitter demonstrates compliance with the peak conducted power limits.

Test procedure:

ANSI C63.10: 2009.

Measurements were performed using a spectrum analyzer with a suitable span to encompass the peak of the fundamental and using the following settings:

RBW = 100kHz, VBW = 100kHz.

The highest emission amplitudes relative to the appropriate limit were measured and recorded in this report.

Results: All out of band spurious emissions are more than 20 dB below the fundamental. See Figures on the following pages.

Offset in the plots shown is 20.5 dB, this is the total loss of attenuators and cable used.

Test Report No.:

**13031902.fcc04**

### **5.1.5 Radiated Spurious Emissions of Transmitter in the restricted bands**

#### **RESULT: Pass**

Date of testing: 2013-06-04

Frequency range: 30MHz - 10GHz

#### Requirements:

FCC 15.205, FCC 15.209 and RSS-Gen Section 7.2.2.

Radiated emissions which fall in the restricted bands, as defined in FCC 15.205(a) and RSS-Gen Table 3, must comply with the radiated emission limits specified in FCC 15.209(a) and RSS-Gen Table 5.

Radiated emissions which fall outside the operation frequency band and outside restricted bands shall either meet the limit specified in FCC 15.209(a)/ RSS Gen Table 5 or be attenuated at least 20dB below the power level in the 100kHz bandwidth within the band that contains the highest level of the desired power (the less severe limit applies).

#### Test procedure:

ANSI C63.10: 2009.

The EUT was placed on a nonconductive turntable 0.8m above the ground plane. Before final measurements of radiated emissions were performed, the EUT was scanned to determine its emission spectrum profile. The physical arrangement of the test system, the associated cabling and the EUT orientation (X, Y, Z) were varied in order to ensure that maximum emission amplitudes were attained.

The spectrum was examined from 30MHz to the 10th harmonic of the highest fundamental transmitter frequency. Final radiated emission measurements were made at 3m distance.

At each frequency where a spurious emission was found, the EUT was rotated 360° and the antenna was raised and lowered from 1 to 4m in order to determine the emission's maximum level. Measurements were taken using both horizontal and vertical antenna polarizations.

The highest emission amplitudes relative to the appropriate limit were recorded in this report. Field strength values of radiated emissions at frequencies not listed in the tables are more than 20 dB below the applicable limit.

Test Report No.:

**13031902.fcc04**

Page 29 of 42

**Table 7: Radiated Emission of the transmitter in restricted bands, 30MHz - 10GHz, Horizontal and Vertical Antenna Orientations, EUT Mode 1: Hopping**

Freq. [MHz]	Antenna Orientation	Level Peak [dBµV/m]	Limit Average [dBµV/m]	Limit Peak [dBµV/m]	Result
1436	Vertical	36.4	54	74	Pass
4158	Horizontal	39.5	54	74	Pass
4797	Vertical	41.0	54	74	Pass
5161	Vertical	40.6	54	74	Pass
7740	Vertical	38.4	54	74	Pass
9446	Vertical	39.6	54	74	Pass

**Notes:**

1. Field strength values of radiated emissions at frequencies not listed in the table above are more than 20 dB below the applicable limit.
2. Measurement uncertainty is  $\pm 5.0$ dB.
3. The EUT was tested as shown in figure 1, the measuring antenna was varied in horizontal and vertical orientations and also around it's axis and height. The reported value is the worst case found at the reported frequency.
4. Tested with EUT in operation mode 1, it's intended use, as described in section 2.2, the 6 worst case values noted.
5. A Peak detector was used with a bandwidth of 1 MHz.
6. Peak values already within Average limits, therefor Average not tested.

Used test equipment and ancillaries:

15453	99699	99861	99847	99855

865.200	Vertical	39.1	46.0	Pass
877.380	Vertical	39.2	46.0	Pass

Table 8 Radiated emissions of the EUT, normal mode.

The results of the radiated emission tests, carried out in accordance with 47 CFR Part 15 section 15.209 are depicted in Table 8. The system is tested as in whole, being the worst case situation. So with all equipment as shown in Figure1 in place and functioning.

#### Notes:

1. Field strength values of radiated emissions at frequencies not listed in the table above are more than 20 dB below the applicable limit.
2. Measurement uncertainty is  $\pm 5.0$ dB
3. The reported field strength values are the worst case values at the indicated frequency. The receiving antenna was varied in horizontal and vertical orientations and also in height (between 1m and 4m).
4. A Quasi-peak detector was used with a resolution bandwidth of 120 kHz.
5. The EUT was tested in both passive mode (i.e. without a tag in its proximity) and in activated mode (i.e. with a tag in its proximity). Maximum values have been noted.

Used test equipment and ancillaries:

## 5.2 AC Power Line Conducted Measurements

### 5.2.1 AC Power Line Conducted Emission of Transmitter

**RESULT: Pass**

Date of testing: 2013-05-16

Requirements: FCC 15.207 and RSS-Gen Section 7.2.4.

Except when the requirements applicable to a given device state otherwise, for any license-exempt radio communication device equipped to operate from the public utility AC power supply, either directly or indirectly, the radio frequency voltage that is conducted back onto the AC power lines in the frequency range of 0.15 MHz to 30 MHz shall not exceed the limits shown in the following table. The tighter limit applies at the frequency range boundaries.

Frequency of Emission (MHz)	Conducted Limit (dB $\mu$ V) Quasi-Peak	Conducted Limit (dB $\mu$ V) Average
0.15 – 0.5	66 to 56*	56 to 46*
0.5 – 5	56	46
5 - 30	46	50

\*Decreases with the logarithm of the frequency.

Test Report No.:

**13031902.fcc04**

Page 32 of 42

Frequency (MHz)	Measurement results (dB $\mu$ V) Neutral/L2		Measurement results (dB $\mu$ V) Line 1		Limits (dB $\mu$ V)		Result
	QP	AV <sup>(note 4)</sup>	QP	AV <sup>(note 4)</sup>	QP	AV	
0.15000	36.6	--	35.0	--	66.0	56.0	PASS
0.21610	30.5	--	33.9	--	65.0	55.0	PASS
14.27531	35.0	--	35.1	--	60.0	50.0	PASS
14.97150	26.6	--	20.0	--	60.0	50.0	PASS
16.46754	28.7	--	33.9	--	60.0	50.0	PASS
20.24170	31.2	--	25.0	--	60.0	50.0	PASS

The results of the conducted emission tests, carried out in accordance with 47 CFR Part 15 section 15.207(a) and RSS-Gen Section 7.2.4, at the 120 Volts/ 60 Hz AC mains connection terminals of the power supply which was connected to the AUX2 which connects to the EUT, are depicted in the table above. The system is tested as in whole, so with all equipment as shown in Figure 1 in place and functioning. Being the worst case situation. See plots on pages 32 – 33.

**Notes:**

1. Tests were performed with the EUT in Hopping Mode, it's intended use.
2. Measurement uncertainty is  $\pm 3.5$ dB
3. The resolution bandwidth used was 9 kHz.
4. Qp values are already within Av limits, therefor not retested on Av.

## **6. Number of hopping channels, Carrier frequency separation, Average time of occupancy**

**RESULT: Pass**

Date of testing:

2013-05-15

Requirements:

FCC 15.247(a)(1)(i) and RSS-210 A8.1(c).

For frequency hopping systems operating in the 902–928 MHz band: if the 20 dB bandwidth of the hopping channel is less than 250 kHz, the system shall the average time of occupancy on any frequency shall not be greater than 0.4 seconds within a 20 second period; if the 20 dB bandwidth of the hopping channel is 250 kHz or greater, the system shall use at least 25 hopping frequencies and the average time of occupancy on any frequency shall not be greater than 0.4 seconds within a 10 second period. The maximum allowed 20 dB bandwidth of the hopping channel is 500 kHz.

Frequency hopping systems shall have hopping channel carrier frequencies separated by a minimum of 25 kHz or the 20 dB bandwidth of the hopping channel, whichever is greater.

Test procedure:

ANSI C63.10: 2009.

A spectrum analyzer was connected to the antenna port of the EUT.

Offset in the plots shown is 20.5 dB, this is the total loss of attenuators and cable used.

Test Report No.:

**13031902.fcc04**

Page 36 of 42

Date: 15.MAY.2013 13:57:55

Plot showing 50 hopping frequencies as required by section FCC 15.247(a)(1)(i) and RSS-210 A8.1(c), as measured on a spectrum analyzer.

Requirement: the 20 dB bandwidth of the hopping channel is less than 250 kHz, the system shall therefore have at least 50 hopping channels.

Result: **Pass**

Page 41 of 42

Table on previous page shows average time of occupancy per channel is less than 0.4 seconds and each frequency is used equally.

Note: Percentage of total On Time = (Dwell time(ms) / Period time (ms) of 1 cycle) \* 100%

Limit: The 20 dB bandwidth of the hopping channel is less than 250 kHz, the system shall therefore have an average time of occupancy not greater than 0.4 seconds within a 20 second period.

Result: **Pass**
