1.0 CERTIFICATION OF TEST DATA

Aegis Labs, Inc. operates as both a Nevada and California Corporation with no organizational or financial relationship with any company, institution, or private individual.

Testing and engineering functions provided by Aegis Labs are furnished through the use of part-time, full-time or consulting engineers with the appropriate qualifications to carry out their duties. The intended purpose of this test report is to describe the measurement procedure and to determine whether the equipment under test “EUT” complies with both the conducted and radiated limits. Limits for emissions testing are described under 47 CFR Part 15, Subpart C (Section 15.247).

The data, data evaluation and equipment configuration represented herein are a true and accurate representation of the Equipment Under Test (EUT) under the requirements specified in the emissions standard as described below. The test results contained in this report are only representative of the test sample tested as described in Section 2.0 of this report.

The test results provided within this report, indicate that the information technology equipment has been found to be in **COMPLIANCE** with the test specifications based upon the following RF compliance standards:

Pass/Fail determination is based upon the nominal values of the test data.

PURPOSE OF TEST: To demonstrate compliance with the relevant standards described in Section 1.0 of this report.

TEST(S) PERFORMED: Refer to Table in Section 1 of this report.

All calibration vendors were responsible for certifying Aegis Labs, Inc. test equipment as per the manufacturer's specifications and that the equipment is calibrated using instruments and standards where the accuracy is traceable to the National Institute of Standards and Technology (NIST). Calibration of all test equipment conforms to ANSI/NCSL Z540-1 and ISO 10012-1 and/or ISO/IEC Guide 17025 compliance (Additionally, other pertinent test equipment will carry MIL-STD-45662A). All calibration documents are on file with Aegis Labs, Inc., with copies provided upon request.

3.0 DESCRIPTION OF EUT

3.1 EUT Description

Equipment Under Test (EUT)	
Trade Name:	Intel PRO/wireless LAN 2100 3B Mini PCI Adapter
Model Number:	PA3272U-1MPC
Frequency Range:	2.412 – 2.462 GHz
Type of Transmission:	Direct Sequence Spread Spectrum
Transfer Rate:	1/2/5.5/11 Mbps
Number of Channels:	11
Modulation Type:	DBPSK, DQPSK, CCK
Antenna Type:	Hirose U.FL-R-SMT mates with cable connector U.FL-LP-066
Antenna Gain (See Note 2):	Toshiba Dual Band Film Antenna = 0.6dBi with cable loss Toshiba Wide Dual Band Film Antenna = 2.0dBi with cable loss
Transmit Output Power:	16 dBm (Typical) Please see Appendix I (Data Sheets) for actual output power.
Power Supply:	3.3VDC from computer MPCI slot.
Number of External Test Ports Exercised:	2 Antenna Ports (1 Main & 1 Auxiliary)

The Intel PRO/wireless LAN 2100 3B Mini PCI Adapter is an embedded 2.4 GHz Wireless Local Area Network Mini-PCI adapter. The Mini-PCI Type 3B form factor is designed for notebook computer systems where overall thickness must be kept to an absolute minimum. It is capable of a data rate of up to 11 Mbps at 2.4 GHz. Please refer to Section 3.2 of this report for a further description of the configuration tested.

NOTE 1: For a more detailed description, please refer to the manufacture's specifications or User's Manual.

NOTE 2: The EUT was tested separately with two different sets of antennas (Toshiba Dual Band Film antennas, and Toshiba Wide Dual Band Film Antennas). Refer to each antenna specifications.

3.1.1 Channel Number and Frequencies

Eleven channels are provided for the EUT.

Channel	Frequency (MHz)
1	2412
2	2417
3	2422
4	2427
5	2432
6	2437

8	2447
9	2452
10	2457
11	2462

3.2 EUT Configuration

The EUT was set-up according to the ANSI C63.4: 1992 guidelines for emissions testing. For emissions testing the EUT (Intel PRO/wireless LAN 2100 3B Mini PCI Adapter, Model Number: PA3272U-1MPC) had a loaded antenna connected to both its main and auxiliary ports. All the appropriate test ports were exercised during both the pre-qualification and final evaluation scans.

This report documents the emissions of the co-located radio modules. The Bluetooth transmitter module has been certified with respect to FCC Part 15 Subpart C requirements (FCC ID: CJ6UPA3232BT).

The EUT was tested in two different configurations.

- 1) With Wide Dual Band Film Antennas
- 2) With Dual Band Film Antennas.

For both configurations the EUT was tested installed in the Mini-PCI slot of the Toshiba host computer. The EUT was then connected to a set of antennas via its main and auxiliary Hirose U.FL-R-SMT ports. Data for both sets of antennas can be found in Appendix I.

For conducted emissions at the antenna port the Toshiba host computer was connected to an NEC monitor and IBM mouse via its video and USB ports respectively.

For conducted emissions at the AC mains port and radiated emissions, the Toshiba host computer was connected to a Hayes modem, Canon printer, NEC monitor, and IBM mouse via its serial, parallel, video, and mouse ports respectively.

The low (channel 1), middle (channel 6), and high (channel 11) were tested. The EUT was transmitting and receiving on a continuous basis.

After preliminary scans, it was found that when the EUT was configured with the Dual Band Film Antennas, the EUT was operating in the worst-case configuration. The remainder of the test was completed with the Dual Band Film Antennas. In this configuration, WLAN and Bluetooth transmitters were operated individually in a continuously transmitting mode and tested separately. Also, the transmitters were tested transmitting simultaneously. The final conducted as well as radiated data was taken in this mode of operation. Refer to Appendix I for the results of the final testing.

3.5 Cabling Diagram and Description

- Cable 1: This is a 6-foot braid and foil shielded round cable connecting the Toshiba host computer to the Canon printer. It has a metallic DB-25 type connector at the computer end and a metallic 36-pin centronics type connector at the printer end. The cable is bundled to a length of one meter and the shield of the cable is grounded to the chassis of both devices via the connector shells.
- Cable 2: This is a 6-foot braid and foil shielded round cable connecting the host Toshiba laptop computer with the NEC monitor. It has metallic DB-15 type connector at the computer end and is hardwired to the monitor. The cable is bundled to a length of one meter and the shield of the cable is grounded to the chassis of both devices via the connector shells.
- Cable 3: This is a 6-foot braid and foil shielded round cable connecting the Toshiba host computer to the Hayes modem. It has a metallic DB-9 type connector at the computer end and a metallic DB-25 type connector at the modem end. The cable is bundled to a length of one meter and the shield of the cable is grounded to the chassis of both devices via the connector shells.
- Cable 4: This is a 1-meter foil shielded round cable connecting the Toshiba laptop computer to the IBM mouse. It has a metallic 6 pin Mini DIN type connector at the computer end and is hardwired at the mouse end. The shield of the cable is grounded to the chassis via the connector shell.

4.0 TEST EQUIPMENT AND TEST SETUPS

The test equipment settings and functions are selected using the guidance of ANSI C63.4-1992. All test equipment setups and operations during conducted and radiated emissions testing are in accordance with this reference document.

4.1 Conducted Emissions At AC Mains Port

During conducted emissions measurements, a spectrum analyzer was used as the measuring instrument along with a preselector and quasi-peak detector. A 10 dB attenuation pad was used for the protection of the spectrum analyzer input stage. The conducted emissions from the EUT in the frequency range from 150 kHz to 30 MHz were captured for graphical display through the use of automated LABVIEW EMI measurement software. All graphical readings were measured in the “Peak” mode only to reduce testing time. Upon completion of the graphical scan, the test lab personnel performed the conducted measurement scan manually using the spectrum analyzer front panel keys. All peak measurements coming within 3 dB of the limit line were “Averaged” and/or “Quasi-Peaked” and denoted appropriately in the EXCEL spreadsheet.

The Equipment Under Test (EUT) was configured as a system with peripherals connected, so that at least one interface port of each type is connected to one external peripheral when tested for conducted emissions according to ANSI C63.4: 1992. The EUT was tested in a tabletop configuration.

The six highest emission readings for Line 1 and Line 2 are highlighted on the data sheets in Appendix I. The graphical scans only reflect peak readings while the tabulated data sheets reflect peak, average, and/or quasi-peak readings which ever applies.

4.1.1 Conducted Emissions At AC Mains Port – Test Setup

4.2 Radiated Emissions

A spectrum analyzer was used as the measuring instrumentation along with a preselector and quasi-peak-detector. The pre-amplifiers were used to increase the sensitivity of the instrument. The spectrum analyzer was used in the peak detector mode with the “max-hold” feature activated and in Positive Peak mode. In this mode, the spectrum analyzer records the highest measured reading over all the sweeps. The quasi-peak detector was used only for those readings, which are marked accordingly in the data sheet. The effective measurement bandwidth used for the radiated emissions test was 120 kHz for (30 MHz- 1000 MHz). The spectrum analyzer operated such that the modulation of the signal was filtered out to set the analyzer in linear mode. For testing beyond 1000 MHz a spectrum analyzer capable of taking reading above 1000 MHz was connected to the high frequency amplifier, where these measurement readings were taken with the transducer placed at a 3-meter test distance from the EUT.

The Open Area Test Sites (OATS) was used for radiated emission testing. These test sites are designed according to ANSI C63.4: 1992 and ANSI C63.7: 1992 guidelines. The Measurements were conducted in accordance with ANSI C63.4: 1992 and ANSI C63.7: 1992 requirements.

Broadband biconical, log periodic, and horn antennas were used as transducers during the measurement reading phase. The frequency spans were wide (30 MHz-88 MHz, 88 MHz-216 MHz, 216 MHz- 300 MHz, and 300 MHz- 1000 MHz). After 1000 MHz the horn antenna was used to measure emissions. The six highest emission readings in both horizontal and vertical polarities are highlighted on the data sheets in Appendix I.

4.2.1 Radiated Emissions – Test Setup

4.3 Maximum Peak Output Power Measurement

A power meter along with a power sensor was used to measure the maximum peak output power. The low (channel 1), middle (channel 6), and high (channel 11) were measured as well as data rates 1, 5.5, and 11 Mbps.

The EUT maximum peak output power is less than 1 Watt. Please refer to Appendix I for the data sheets.

4.3.1 Maximum Peak Output Power Measurement – Test Setup

4.4 Occupied Bandwidth Measurement

A spectrum analyzer was used to measure the occupied bandwidth. The bandwidth was measured using a direct connection from the RF output port of the EUT to the spectrum analyzer using a low loss cable and a DC block. The resolution bandwidth was 100 kHz and the video bandwidth was 300 kHz.

The EUT bandwidth is at least 500 kHz. Please refer to Appendix I for graphical plots.

4.4.1 Occupied Bandwidth Measurement – Test Setup

4.5 Spectral Power Density Measurement

A spectrum analyzer was used to measure the spectral power density. It was measured using a direct connection from the RF output port of the EUT to the spectrum analyzer using a low loss cable and a DC block. The resolution bandwidth was 3 kHz and the video bandwidth was 10 kHz. The highest 4.5 MHz of the signal was used as the frequency span with the sweep rate being 1 second for every 3 kHz of span.

The EUT spectral power density does not exceed 8 dBm in any 3 kHz band. Please refer to Appendix I for graphical plots.

4.5.1 Spectral Power Density Measurement – Test Setup

4.6 Spurious Emissions Measurement At The Antenna Terminal

A spectrum analyzer was used to measure the spurious emissions at the antenna terminal. It was measured using a direct connection from the RF output port of the EUT to the spectrum analyzer using a low loss cable and a DC block. The resolution bandwidth was 100 kHz and the video bandwidth was 300 kHz. The spans were wide enough to include all the harmonics and emissions that were produced by the intentional radiator.

The EUT RF power that is produced in any 100 kHz bandwidth outside the frequency band in which the spread spectrum intentional radiator is operating, the radio frequency power that is produced by the intentional radiator is at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power. Please refer to Appendix I for graphical plots.

4.6.1 Spurious Emissions Measurement At The Antenna Terminal – Test Setup

4.7 Band Edge Measurement At The Antenna Terminal

A spectrum analyzer was used to measure the band edge measurements at the antenna terminal with the EUT transmitting at 2412 MHz (channel 1) and 2462 MHz (channel 11). It was measured using a direct connection from the RF output port of the EUT to the spectrum analyzer using a low loss cable and a DC block. The resolution bandwidth was 1 MHz and the video bandwidth was 1 MHz. It was verified that the band edge measurements were not above the limit in the restricted bands below 2390 MHz and above 2483.5 MHz. Please refer to Appendix I for graphical plots.

4.7.1 Band Edge Measurement At The Antenna Terminal – Test Setup

4.8 20dB Bandwidth Measurement

A spectrum analyzer was used to measure the 20dB Bandwidth measurements at the antenna terminal with the EUT transmitting at the low, middle and high channel. It was measured using a direct connection from the RF output port of the EUT to the spectrum analyzer using a low loss cable and a DC block. The resolution bandwidth was 30kHz and the video bandwidth was 30kHz. It was verified that the bandwidth is less than 1 MHz. Please refer to Appendix I for graphical plots.

4.8.1 20dB Bandwidth Measurement – Test Setup

4.9 Carrier Frequency Separation Measurement

A spectrum analyzer was used to measure the Carrier Frequency Separation measurements at the antenna terminal with the EUT operating in its normal operating mode. It was measured using a direct connection from the RF output port of the EUT to the spectrum analyzer using a low loss cable and a DC block. The resolution bandwidth was 100kHz and the video bandwidth was 100kHz. The frequency span was wide enough to include two peaks of adjacent channels. It was verified that the carrier frequency separation was greater than the 20dB bandwidth. Please refer to Appendix I for graphical plots.

4.9.1 Carrier Frequency Separation Measurement – Test Setup

4.10 Number of Hopping Frequencies Measurement

A spectrum analyzer was used to measure the Number of Hopping Frequencies measurements at the antenna terminal with the EUT operating in its normal operating mode. It was measured using a direct connection from the RF output port of the EUT to the spectrum analyzer using a low loss cable and a DC block. The resolution bandwidth was 1MHz and the video bandwidth was 1MHz. The frequency span was wide enough to include all of the peaks in the frequency band of operation. It was verified that there were 79 hopping frequencies. Please refer to Appendix I for graphical plots.

4.10.1 Number of Hopping Frequencies Measurement – Test Setup

4.11 Average Time of Occupancy Measurement

A spectrum analyzer was used to measure the Average Time of Occupancy measurements at the antenna terminal with the EUT operating in its normal operating mode. It was measured using a direct connection from the RF output port of the EUT to the spectrum analyzer using a low loss cable and a DC block. The resolution bandwidth was 1MHz and the video bandwidth was 1MHz. The frequency span was set to 0Hz with a sweep time of 60 msec to determine the time for each transmission. Once the sweep time for each transmission was determined, it was calculated that the EUT was not transmitting more than 400msec during a 30 second period on any frequency. Please refer to Appendix I for graphical plots.

4.11.1 Average Time of Occupancy Measurement – Test Setup

5.0 MODIFICATIONS AND RECOMMENDATIONS

There were no modifications done to the EUT.

Description:	Spurious Emissions Measurements - Radiated
Results:	In any 100 kHz bandwidth outside the frequency band in which the spread spectrum intentional radiator is operating, the radio frequency power that is produced by the intentional radiator is at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement.

CONFIGUARTION: WLAN ON, BT OFF		TEMPERATURE:	25 C
		HUMIDITY:	38% RH
		TIME:	8:00 AM

Standard:	FCC CFR 47, Part 15.207
Description:	AC Power Conducted Emissions
Results:	Passes FCC Limits

NOTE: During preliminary scans, there wasn't any difference which channel, data rate, or which set of antennas were used with the EUT, therefore only Channel 1 at a data rate of 1 Mbps with the Dual Band Film antennas were used for final testing.

		HUMIDITY:	38% RH
		TIME:	8:00 PM

Standard:	FCC CFR 47, Part 15.247(a)(1)(ii)
Description:	Average Time of Occupancy
Results:	The EUT does not transmit for more than 400msec during a 30 second period on any frequency. (See Plot)

TEST RESULTS SUMMARY
The average time of occupancy is 3.00msec for every 60msec period. Therefore: 60msec = 1sec and the EUT average time of occupancy is 3.00msec for every 1sec period then the EUT Average Time of Occupancy is, 3.00msec x 30sec = 90msec per 30sec period

SPECTRAL POWER DENSITY MEASUREMENT

CLIENT:	Toshiba Corporation	DATE:	12/14/02
EUT:	WLAN & Bluetooth Modules	PROJECT NUMBER:	INTEL-021205
MODEL NUMBER:	PA3171WL & PA3232BT	TEST ENGINEER:	Rick Candelas
SERIAL NUMBER:	000423001A77 & 00037A02E888	SITE #:	2
CONFIGURATION: <i>Conducted Measurement @ BT Port</i>		TEMPERATURE:	25 C
		HUMIDITY:	38% RH
		TIME:	8:00 AM

Standard:	FCC CFR 47, Part 15, 15.247(D)
Description:	Power Spectral Density Measurement
Results:	Transmitted power density averaged over any 1 second interval is not greater than 8 dBm in any 3 kHz bandwidth within these bands

TEST RESULTS SUMMARY	
Data	Result
Low Channel Power Spectral Density	-4.67 dBm – Pass
Mid Channel Power Spectral Density	-3.67 dBm – Pass
High Channel Power Spectral Density	-4.00 dBm – Pass

CONFIGUARTION: <i>Conducted Measurement @ BT Port</i>		TEMPERATURE:	25 C
		HUMIDITY:	38% RH
		TIME:	9:00 AM

Standard:	FCC CFR 47, Part 15, 15.247(c)
Description:	Conducted Spurious Emissions
Results:	In any 100 kHz bandwidth outside the frequency band in which the spread spectrum intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement.

TEST RESULTS SUMMARY	
Data	Result
Low Channel Spurious Emissions – Antenna Terminal - 30MHz – 2GHz	Max Spur Signal @ -62.17dBm – Pass
Low Channel Spurious Emissions – Antenna Terminal - 2GHz – 10GHz	Max Spur Signal @ -61.00dBm – Pass
Low Channel Spurious Emissions – Antenna Terminal - 10GHz – 20GHz	Max Spur Signal @ -59.83dBm – Pass
Low Channel Spurious Emissions – Antenna Terminal - 20GHz – 26.5GHz	Max Spur Signal @ -56.83dBm – Pass

AVERAGE TIME OF OCCUPANCY MEASUREMENT

CLIENT:	Toshiba Corporation	DATE:	12/14/02
EUT:	WLAN & Bluetooth Modules	PROJECT NUMBER:	INTEL-021205
MODEL NUMBER:	PA3171WL & PA3232BT	TEST ENGINEER:	Rick Candelas
SERIAL NUMBER:	000423001A77 & 00037A02E888	SITE #:	2
CONFIGUARTION: <i>Conducted Measurement @ BT Port</i>		TEMPERATURE:	25 C
		HUMIDITY:	38% RH
		TIME:	1:00 PM

Standard:	FCC CFR 47, Part 15.247(a)(1)(ii)
Description:	Average Time of Occupancy
Results:	The EUT does not transmit for more than 400msec during a 30 second period on any frequency. (See Plot)

TEST RESULTS SUMMARY
The average time of occupancy is 2.90msec for every 60msec period. Therefore: 60msec = 1sec and the EUT average time of occupancy is 2.90msec for every 1sec period then the EUT Average Time of Occupancy is, 2.90msec x 30sec = 87msec per 30sec period
