

## 8 SAR MEASURMENT RESULTS

Since the EUT was installed in the same host laptop and used the same antenna as the previous CCS report 07U11378-8, therefore the following test positions and modes were all chosen based on the worst-case results from the previous report. The modes were also chosen based on the higher output power.

### 8.1 2.4 GHZ BAND

#### 8.1.1 SECONDARY LANDSCAPE

				
<b>802.11b 2.4 GHz Chain A (Main)</b>				
Channel	f (MHz)	Measured SAR 1g (mW/g)	Power Drift (dB)	Extrapolated <sup>1)</sup> SAR 1g (mW/g)
6	2437	0.315	0.000	0.315
6 <sup>4)</sup>	2437	0.319	0.000	0.319
<b>802.11b 2.4 GHz Chain B (Sub-A)</b>				
6	2437	0.235	0.000	0.235
<b>802.11g 2.4 GHz Chain A (Main)</b>				
6	2437	0.057	0.000	0.057
<b>802.11g 2.4 GHz Chain B (Sub-A)</b>				
6	2437	0.045	-0.023	0.045
Notes:				
1) The exact method of extrapolation is Measured SAR $\times 10^{(-\text{drift}/10)}$ . The SAR reported at the end of the measurement process by the DASY4 system can be scaled up by the Power drift to determine the SAR at the beginning of the measurement process.				
2) The SAR measured at the middle channel for this configuration is at least 3 dB lower (0.8 mW/g) than SAR limit (1.6 mW/g), thus testing at low & high channel is optional.				
3) Please see attachments for the detailed measurement data and plots showing the maximum SAR location of the EUT.
