*used before calibration due date.

All horn antennas at and above the 33-50 GHz band are standard gain horns. In accordance with ANSI C63.10 clause 4.4.3 (a) Standard gain horns need not be periodically recalibrated, unless damage or deterioration is suspected or known to have occurred. If a standard gain horn is not periodically recalibrated, then its critical dimensions (see IEEE Std 1309-2005) shall be verified and documented on an annual basis.

UL measures the critical dimensions on an annual basis and checks for damage and deterioration before each test.

6. DUTY CYCLE

LIMIT

None, for reporting purposes only.

TEST PROCEDURE

The fundamental is measured using a Standard Gain Horn Antenna, feeding a Diode Detector connected to an Oscilloscope. Pulse widths, burst lengths, and periods are measured, then the duty cycle is calculated.

The total Duty Cycle is calculated as the duty cycle across bursts multiplied by the duty cycle within each burst.

The duty cycle factor is calculated as:

Duty Cycle Factor (dB) = $10 * \log(1 / x)$
Where X = Duty Cycle (linear)

RESULTS

The signal is continuously present in all modes therefore the duty cycle is 100%.
Information on the chirp is given for informational purposes.

20 dB Bandwidth Limit

§15.215(c) Intentional radiators operating under the alternative provisions to the general emission limits, as contained in §§15.217 through 15.257 and in subpart E of this part, must be designed to ensure that the 20 dB bandwidth of the emission, or whatever bandwidth may otherwise be specified in the specific rule section under which the equipment operates, is contained within the frequency band designated in the rule section under which the equipment is operated.

FMCW DESENSITIZATION FACTORS

The measured bandwidth of the used to calculate the FMCW desensitization factor which is added to the measured values of peak detection measurements. The shortest ramp time is used to calculate the Desensitization Factor, to yield the worst-case desensitization.

Keysight Technologies Application Note 5952-1039 “Spectrum and Signal Analysis Pulsed RF” provides the derivation of the FMCW Desensitization Factor for Gaussian-shaped Resolution Bandwidth Filters in Appendix B “IF Amplifier Response and Distortion”.

Equation B-10 is excerpted:

$$\alpha = \frac{1}{\sqrt[4]{1 + \left(\frac{2\ln(2)}{\pi}\right)^2 \left(\frac{F_s}{T_s B^2}\right)^2}} \quad (B-10)$$

Where

α is the reduction in amplitude

F_s = Sweep Width

T_s = Sweep Time

B = 3 dB IF Bandwidth = RBW

9. UNWANTED RADIATED EMISSIONS

9.1. LIMITS AND PROCEDURES

LIMITS

§15.249_(a) Except as provided in paragraph (b) of this section, the field strength of emissions from intentional radiators operated within these frequency bands shall comply with the following:

Fundamental frequency	Field strength of fundamental (millivolts/meter)	Field strength of harmonics (microvolts/meter)
24.0-24.25 GHz	250 (108 dBuV/m)	2500 (68 dBuV/m)

§15.249 (d) Emissions radiated outside of the specified frequency bands, except for harmonics, shall be attenuated by at least 50 dB below the level of the fundamental or to the general radiated emission limits in §15.209, whichever is the lesser attenuation.

(e) As shown in § 15.35(b), for frequencies above 1000 MHz, the field strength limits in paragraphs (a) and (b) of this section are based on average limits. However, the peak field strength of any emission shall not exceed the maximum permitted average limits specified above by more than 20 dB under any condition of modulation.

The §15.209 average limit above 960 MHz is 500 uV/m at 3 meters, equivalent to 54 dBuV/m at 3 meters.

The field strength of the fundamental is 118.67 dBuV/m at 3 meters, peak.
An attenuation of 50 dB yields 68.67 dBuV/m at 3 meters.

The §15.209 peak limit above 960 MHz is 5000 uV/m at 3 meters, equivalent to 74 dBuV/m at 3 meters.

The §15.209 limits correspond to the lesser attenuation, for both peak and average emissions.

§15.209 Radiated emission limits: general requirements.

(a) Except as provided elsewhere in this subpart, the emissions from an intentional radiator shall not exceed the field strength levels specified in the following table:

Frequency (MHz)	Field strength (microvolts/meter)	Measurement distance (meters)
0.009-0.490	2400/F(kHz)	300
0.490-1.705	24000/F(kHz)	30
1.705-30.0	30	30
30-88	100**	3
88-216	150**	3
216-960	200**	3
Above 960	500	3

PROCEDURE

ANSI C63.10: 2013

KDB 414788 Open Field Site (OFS) and Chamber Correlation Justification

Base on FCC 15.31(f)(2): Measurement may be performed at a distance closer than that specified in the regulations; however, an attempt should be made to avoid making measurement in the near field.

OFS and chamber correlation testing had been performed and chamber measured test result is the worst case test result.

FMCW DESENSITIZATION FACTORS

The measured bandwidth of each harmonic is used to calculate the FMCW desensitization factor which is added to the measured values to the peak measurements.
