RE: Lamson & Sessions

FCC ID: DE4-HW2181T

The following is in response to the comments made on the above referenced application.

1) The FCC desires the 2 part statement to be on the device. They allow smaller devices (defined as 8x10 cm) to place it in the manual. However this appears to be larger than this. Please review.

This device is smaller than the palm of the hand, measuring 6.5 cm x 10.1 cm. Below is a photograph on the palm of the hand.

2) Battery voltage plot seems to affect output by 3 dB or more according to plots provided. The fundamental is close to the limit and could pass/fail depending on voltage present during that particular test. Please ensure that fundamental was measured with fresh batteries (i.e. at 6.7 VDC mentioned).

Worst case emissions are always re-checked with a fresh battery employed. The voltage reported was that of the fresh batteries used when measuring the worst case emissions
