Test Sample: Antenna Pedestals

Model Numbers Tested: Primary Pedestal: NP10 PAB
Secondary Pedestal: NP 10 SAB

FCC ID: DO4NEOPS

Power Requirements: 120 VAC, 60 Hz

Frequency of Operation: 7.975, 8.125, 8.275, and 8.425

The Antenna Pedestals tested were provided as worst case in accordance with Checkpoint Systems, Inc. The Neo family of PAB and SAB consist of the following versions:

- NP10 PAB W/HUB
- NP10 SAB
- NP20 PAB W/HUB
- NP20 SAB
- NG10 PAB W/HUB
- NG10 SAB

Tests Performed

The test methods performed on the Antenna Pedestals are shown in Table 1 below:

Table 1 – Test Methods

FCC Part 15, Subpart C	Test Method
15.203	Antenna Requirements
15.207 (a)	Conducted Emissions
15.223 (a)	6 dB and 99% Bandwidth
15.223 (a)	Fundamental Field Strength
15.223 (b)	Field Strength of Harmonics and Spurious outside of band

General Test Requirements

1. All radiated emissions measurements were performed on an Open Area Test Site (OATS), listed with the FCC, in accordance with FCC Section 15.31(d).
2. All measurements were performed at test distance specified on each data sheet.
3. The EUT was rotated throughout 360 degrees for all radiated emissions measurements as specified in FCC Section 15.31(f)(5).
4. All readily accessible EUT controls were adjusted in such a manner as to maximize the level of emissions in accordance with FCC Section 15.31(g).
5. In accordance with Checkpoint Systems, Inc. appropriate accessories were attached to all EUT ports during the performance of radiated emissions measurements as required by FCC Section 15.31(i).
6. The frequency spectrum was investigated from the lowest frequency generated in the device up to at least the 10th harmonic of the highest fundamental frequency in accordance with FCC Section 15.33(a)(1).
7. All measurements were taken with a peak detector function as specified in FCC Section 15.35(a). The duty cycle, calculated in accordance with FCC Section 15.35(c), was applied to the peak readings in order to obtain the average value of emissions. The peak value of emissions was verified to meet the 20 dB requirement of FCC Section 15.35(b).

Non-Warranty Provision

The testing services have been performed, findings obtained and reports prepared in accordance with generally accepted laboratory principles and practices. This warranty is in lieu of all others, either expressed or implied.

Non-Endorsement

This test report contains only findings and results arrived at after employing the specific test procedures and standards listed herein. It is not intended to constitute a recommendation, endorsement or certification of the product or material tested. This test report must not be used by the client to claim product endorsement by NVLAP or any agency of the U.S. Government.

Requirements and Test Results

FCC Section 15.203 – Antenna Requirements

An intentional radiator shall be designed to ensure that no antenna other than that furnished by the responsible party shall be used with the device. The use of a permanently attached antenna or of an antenna that uses a unique coupling to the intentional radiator shall be considered sufficient to comply with the provisions of this section. The manufacturer may design the unit so that a broken antenna can be replaced by the user, but the use of a standard antenna jack or electrical connector is prohibited.

- Results:
In accordance with Checkpoint Systems, Inc the antenna is permanently installed.

FCC Section 15.207(a) – Conducted Emissions

For an intentional radiator that is designed to be connected to the public utility (AC) power line, the radio frequency voltage that is conducted back onto the AC power line on any frequency or frequencies within the band 150 kHz to 30 MHz shall not exceed the limits shown in Table 2, as measured using a 50 μ H/50 ohms line impedance stabilization network (LISN). Compliance with the provisions of the paragraph shall be based on the measurement of the radio frequency voltage between each power line and ground at the power terminal. The lower limit applies at the boundary between the frequency ranges.

Table 2 - Conducted Emission Limits

Frequency of Emission (MHz)	Conducted Limit (dB μ V)	
	Quasi-Peak	Average
0.15 to 0.5	66 to 56*	56 to 46*
0.5 to 5	56	46
5 to 30	60	50

*Decreases due to logarithm of the frequency

- Results:
The conducted emissions observed did not exceed the limits specified in Table 2.

FCC Section 15.223 (a), 6dB and 99% Occupied Bandwidth

If the bandwidth of the emission is less than 10% of the center frequency, the field strength shall not exceed 15 microvolts/meter or (the bandwidth of the device in kHz) divided by (the center frequency of the device in MHz) microvolts/meter at a distance of 30 meters, whichever is the higher level. For the purposes of this section, bandwidth is determined at the points 6 dB down from the modulated carrier.

- Results:

The 6dB bandwidth of the device was 760.00 kHz

Report No. R-3296P-2

Requirements and Test Results (con't)

FCC Section 15.223 (a), Fundamental Field Strength

The field strength of any emission within the band 1.705-10.0 MHz shall not exceed 100 microvolts/meter at a distance of 30 meters. The emission limits in this paragraph are based on measurement instrumentation employing an average detector. The provisions in §15.35(b) for limiting peak emissions apply.

- Results:

The device was operated at a frequency of 8.2 MHz. The maximum Peak reading was 817.72 $\mu\text{V/m}$. The maximum average reading was 22.12 $\mu\text{V/m}$.

Table 3 - Field Strength of Emissions Limits

Fundamental Frequency	Peak Field Strength Limit	Average Field Strength Limit
8.2 MHz	1000 $\mu\text{V/m}$	100 $\mu\text{V/m}$

FCC Section 15.223 (b), Field Strength of Harmonics and Spurious outside of band

Except as provided elsewhere in this subpart, the emissions from an intentional radiator shall not exceed the field strength levels specified in Table 4.

Table 4 - Radiated Emission Limits

Frequency of Emission (MHz)	Field Strength (microvolts/meter)	Measurement Distance (meters)
30 to 88	100	3
88 to 216	150	3
216 to 960	200	3
Above 960	500	3

- Results:

The field strength of spurious radiated emissions did not exceed the limits specified in Table 4.

General Requirements FCC

Spectrum Analyzer Desensitization Considerations

Due to the nature of the emissions being measured, a pulse desensitization calculation was utilized in order to provide accurate peak measurements. The following formula was utilized:

τ_{eff} = Minimum Pulse Width = 4 μ S

K = 1.5

B = Bandwidth utilized for measurement = 10 kHz

$$\text{Pulse Desensitization Factor (dB)} = 20 \log_{10} \tau_{eff} \times K \times B$$

$$\text{Pulse Desensitization Factor (dB)} = 20 \log_{10} 4\mu S \times 1.5 \times 10kHz$$

$$\text{Pulse Desensitization Factor (dB)} = 24.437$$

Duty Cycle Correction for Average Reading

In accordance with ANSI C63.10 Paragraph 7.5, the below equation was utilized in order to determine the Average value of a pulsed emission:

Transmitter On Time = 0.256 milliseconds (maximum per cycle)

Transmitter Cycle Time = 9.64 milliseconds (100 ms maximum)

Transmitter Duty Cycle = 2.66 %

CALCULATION

64 pulses of 4 μ s = 256 μ s

Duty Cycle (0.256/9.64) = 2.66 %

Correction Factor = 20 log (0.0266) = -31.52 dB

Serial Number:	1003464400W1490001
Operating Mode:	ST BT, LM Wi-Fi, Tx=31, Rx=31, I/O Cables on GPIO's, Ethernet, LT/SND Cable, RF Coax Cable
Technician:	M. Nowak
Date(s):	08/24/20
Temperature:	24.1 °C
Relative Humidity:	46 %
Detector:	Peak
Test Distance:	10m

Technician:	M. Nowak
Date(s):	8/6/20
Temperature:	27.1 °C
Relative Humidity:	49 %
Detector:	Quasi-peak
Test Distance:	3m

Notes: The frequency range was scanned from 9 kHz to 30 MHz

The emissions observed from the EUT do not exceed the specified limits. The two highest readings relative to the limit are presented.

*Noise floor measurement, minimum sensitivity of measurement system.
