

FCC Part 15.227 Test Report
for
Logitech
on the
Cordless Trackball Mouse
Model: T-RA17

Test Report #: 20207272
Date of Report: August 2, 2000

Job #: J20020727
Date of Test: July 27, 2000

Total No. of Pages Contained in this Report: 12 + data pages

Warnock Hersey

Lab Code 200201-0

This report shall not be reproduced except in full, without written approval of Intertek Testing Services.

This report must not be used to claim product endorsement by NVLAP or any agency of the U.S. Government.

The results contained in this report were derived from measurements performed on the identified test samples. Any implied performance of other samples on this report is dependent on the representative of the samples tested.

2.0 General Description

2.1 Product Description

The EUT transfers data to a receiver hooked to a PC at 27.045 MHz. Data is FSK modulated.

2.2 Related Submittal(s) Grants

This report is for use with an application for certification of a low power transmitter. One transmitter is included in the application. This specific report details the emission characteristics of transmitter.

The FCC ID for the receiver associated with this transmitter is not labeled. The receivers are subject to the notification authorization process. A notification report has been prepared for the receiver.

2.3 Test Methodology

Radiated emission measurements were performed according to the procedures in ANSI C63.4 (1992). All measurements were performed in Open Area Test Sites. Preliminary scans were performed in the Open Area Test Sites only to determine worst case modes. For each scan, the procedure for maximizing emissions in Appendices D and E were followed. All Radiated tests were performed at an antenna to EUT distance of 3 meters, unless stated otherwise in the "Justification Section" of this Application.

2.4 Test Facility

The open area test site used to collect the radiated data was Site 2. This test facility and site measurement data have been fully placed on file with the FCC and NVLAP accredited.

3.3 System Test Configuration

3.3.1 Support Equipment

Item #	Description	Model No.	Serial No.
1	Dell Dimension	T-450	2478075
2	HP monitor	D5258A	DK73795774
3	Logitech Keyboard	SK2500	SCC81621515
4	HP Printer	Desk Jet 340	N/A
5	Best Data VI 90Modem	Smart One	565PX72729
6	Logitech Receiver	-	-

3.3.2 Block Diagram of Test Setup

* = EUT
** = No ferrites on video cable

S = Shielded;
U = Unshielded

F = With Ferrite

3.4 Equipment Modification

Any modifications installed before testing by Logitech will be incorporated in each production model sold/leased in the United States.

No modifications were installed by Intertek Testing Services.

3.5 Additions, deviations and exclusions from standards

No additions, exclusions or deviations to the standard were made.

4.0 Emission Results

AC line conducted emission measurements were not performed as EUT is battery operated.

Radiated emission measurements were performed from 30 MHz to 1000 MHz. Analyzer resolution is 100 kHz or greater for 30 MHz to 1000 MHz.

Data is included of the worst case configuration (the configuration which resulted in the highest emission levels).

A sample calculation, configuration photographs and data tables of the emissions are included. All measurements were performed with peak detection unless otherwise specified.

4.1 Field Strength Calculation

The field strength is calculated by adding the Antenna Factor and Cable Factor, and subtracting the Amplifier Gain (if any) from the measured reading. The basic equation with a sample calculation is as follows:

$$FS = RA + AF + CF - AG$$

where FS = Field Strength in dB(μ V/m)

RA = Receiver Amplitude (including preamplifier) in dB(μ V)

CF = Cable Attenuation Factor in dB

AF = Antenna Factor in dB/m

AG = Amplifier Gain in dB

In the following table(s), the reading shown on the data table reflects the preamplifier gain. An example for the calculations in the following table is as follows:-

$$FS = RR + LF$$

where FS = Field Strength in dB(μ V/m)

RR = RA - AG in dB(μ V)

LF = CF + AF in dB

Assume a receiver reading of 52.0 dB(μ V) is obtained. The antenna factor of 7.4 dB/m and cable factor of 1.6 dB is added. The amplifier gain of 29 dB is subtracted, giving a field strength of 32 dB(μ V/m). This value in dB μ V/m was converted to its corresponding level in μ V/m.

$$RA = 52.0 \text{ dB}(\mu\text{V})$$

$$AF = 7.4 \text{ dB/m}$$

$$RR = 23.0 \text{ dB}(\mu\text{V})$$

$$CF = 1.6 \text{ dB}$$

$$LF = 9.0 \text{ dB}$$

$$AG = 29.0 \text{ dB}$$

$$FS = RR + LF$$

$$FS = 23 + 9 = 32 \text{ dB}(\mu\text{V/m})$$

$$\text{Level in } \mu\text{V/m} = \text{Common Antilogarithm } \{[32 \text{ dB}(\mu\text{V/m})]/20\} = 39.8 \mu\text{V/m}$$

4.2 Radiated Emission Data

The data on the following pages list the significant emission frequencies, the limit and the margin of compliance.

Results: Passed by 10.2 dB at 54.08 MHz
--

Note: a) All emissions not reported are at least 20 dB below the limits

4.3 Conducted Emission Data

The data on the following pages list the significant emission frequencies, the limit and the margin of compliance.

Results: Not Applicable. EUT is battery operated.
--

Note: a) A complete scan from 0.45 - 30 MHz was made.

5.0 Antenna Requirement

X	The transmitter uses a permanently connected antenna.
	The antenna is affixed to the EUT using a unique connector which allows for replacement of a broken antenna, but does NOT use a standard antenna jack or electrical connector.
	The EUT requires professional installation. Please refer to the attached documentation for details).
