

MPE Calculations

Systems operating under the provision of 47 CFR 1.1307(b)(1) shall be operated in a manner that ensures that the public is not exposed to radio frequency energy levels in excess of the FCC guidelines.

The EUT will only be used with a separation of 20 centimeters or greater between the antenna and the body of the user or nearby persons and can therefore be considered a mobile transmitter per 47 CFR 2.1091(b). The MPE calculation for this exposure is shown below.

Using the Foxconn Antennas @ 5 GHz Range with highest output power:

The peak radiated output power (EIRP) is calculated as follows:

$$\text{EIRP} = P + G$$

$$\text{EIRP} = 22.00 \text{ dBm} + 0.37 \text{ dBi}$$

$$\text{EIRP} = 22.37 \text{ dBm} (172.58 \text{ mW})$$

Where

P = Power input to the antenna (mW).

G = Power gain of the antenna (dBi)

Power density at the specific separation:

$$S = PG / (4R^2\pi)$$

$$S = (158.49 \times 1.09) / (4 \times 20^2 \times \pi)$$

$$S = 0.034 \text{ mW/cm}^2$$

Where

S = Maximum power density (mW/cm^2)

P = Power input to the antenna (mW).

G = Numeric power gain of the antenna

R = Distance to the center of the radiation of the antenna (20cm = limit for MPE)

The maximum permissible exposure (MPE) for the general population is 1 mW/cm^2 .

The power density at 20cm does not exceed the 1 mW/cm^2 limit. Therefore, the exposure condition is compliant with FCC rules.

The numeric gain (G) of the antenna with a gain specified in dB is determined by:

$$G = \text{Log}^{-1} (\text{dB antenna gain}/10)$$

$$G = \text{Log}^{-1} (0.37 \text{ dBi}/10)$$

$$G = 1.09$$

Using the Foxconn Antennas @ 2.4 GHz Range with highest output power:

The peak radiated output power (EIRP) is calculated as follows:

$$\text{EIRP} = P + G$$

$$\text{EIRP} = 24.05 \text{ dBm} + 2.60 \text{ dBi}$$

$$\text{EIRP} = 26.65 \text{ dBm} (462.38 \text{ mW})$$

Where

P = Power input to the antenna (mW).

G = Power gain of the antenna (dBi)

Power density at the specific separation:

$$S = PG/(4R^2\pi)$$

$$S = (254.10 \times 1.82) / (4 \times 20^2 \times \pi)$$

$$S = 0.092 \text{ mW/cm}^2$$

Where

S = Maximum power density (mW/cm^2)

P = Power input to the antenna (mW).

G = Numeric power gain of the antenna

R = Distance to the center of the radiation of the antenna (20cm = limit for MPE)

The maximum permissible exposure (MPE) for the general population is 1mW/cm^2 .

The power density at 20cm does not exceed the 1mW/cm^2 limit. Therefore, the exposure condition is compliant with FCC rules.

The numeric gain (G) of the antenna with a gain specified in dB is determined by:

$$G = \text{Log}^{-1} (\text{dB antenna gain}/10)$$

$$G = \text{Log}^{-1} (2.60 \text{ dBi}/10)$$

$$G = 1.82$$

Using the Hitachi Antennas @ 5 GHz Range with highest output power:

The peak radiated output power (EIRP) is calculated as follows:

$$\text{EIRP} = P + G$$

$$\text{EIRP} = 22.00 \text{ dBm} + 3.40 \text{ dBi}$$

$$\text{EIRP} = 25.40 \text{ dBm} (346.74 \text{ mW})$$

Where

P = Power input to the antenna (mW).

G = Power gain of the antenna (dBi)

Power density at the specific separation:

$$S = PG/(4R^2\pi)$$

$$S = (158.49 \times 2.19) / (4 \times 20^2 \times \pi)$$

$$S = 0.069 \text{ mW/cm}^2$$

Where

S = Maximum power density (mW/cm^2)

P = Power input to the antenna (mW).

G = Numeric power gain of the antenna

R = Distance to the center of the radiation of the antenna (20cm = limit for MPE)

The maximum permissible exposure (MPE) for the general population is 1mW/cm^2 .

The power density at 20cm does not exceed the 1mW/cm^2 limit. Therefore, the exposure condition is compliant with FCC rules.

The numeric gain (G) of the antenna with a gain specified in dB is determined by:

$$G = \text{Log}^{-1} (\text{dB antenna gain}/10)$$

$$G = \text{Log}^{-1} (3.40 \text{ dBi}/10)$$

$$G = 2.19$$

Using the Hitachi Antennas @ 2.4 GHz Range with highest output power:

The peak radiated output power (EIRP) is calculated as follows:

$$\text{EIRP} = P + G$$

$$\text{EIRP} = 24.05 \text{ dBm} + 1.90 \text{ dBi}$$

$$\text{EIRP} = 25.95 \text{ dBm} (393.55 \text{ mW})$$

Where

P = Power input to the antenna (mW).

G = Power gain of the antenna (dBi)

Power density at the specific separation:

$$S = PG/(4R^2\pi)$$

$$S = (254.10 \times 1.55) / (4 \times 20^2 \times \pi)$$

$$S = 0.078 \text{ mW/cm}^2$$

Where

S = Maximum power density (mW/cm^2)

P = Power input to the antenna (mW).

G = Numeric power gain of the antenna

R = Distance to the center of the radiation of the antenna (20cm = limit for MPE)

The maximum permissible exposure (MPE) for the general population is 1mW/cm^2 .

The power density at 20cm does not exceed the 1mW/cm^2 limit. Therefore, the exposure condition is compliant with FCC rules.

The numeric gain (G) of the antenna with a gain specified in dB is determined by:

$$G = \text{Log}^{-1} (\text{dB antenna gain}/10)$$

$$G = \text{Log}^{-1} (1.90 \text{ dBi}/10)$$

$$G = 1.55$$
