## **2. Equipment Under Test (EUT)**

The following information (with the exception of the Date of Receipt) has been supplied by the client:

### **2.1. Identification Of Equipment Under Test (EUT)**

#### **Sample #1**

Brand Name:	Multitone
Model Name or Number:	TLA 852/FLA872
Serial Number:	0001413N:01
Nominal Receive Frequency:	169.200 MHz
Country of Manufacture:	UK
FCC ID Number:	E86TLA-FLA
Date of Receipt:	02 December 2002

#### **Sample #2**

Brand Name:	Multitone
Model Name or Number:	TLA 852/FLA872
Serial Number:	0001415N:01
Nominal Receive Frequency:	156.100 MHz
Country of Manufacture:	UK
FCC ID Number:	E86TLA-FLA
Date of Receipt:	02 December 2002

#### **Sample #3**

Brand Name:	Multitone
Model Name or Number:	TLA 852/FLA872
Serial Number:	0001414N:01
Nominal Receive Frequency:	138.075 MHz
Country of Manufacture:	UK
FCC ID Number:	E86TLA-FLA
Date of Receipt:	02 December 2002

### **2.2. Description Of EUT**

The Equipment under test is an alphanumeric Radio Paging Receiver, utilising the CCIR No1. Radio-paging code format (POCSAG). The unit has tone-alert, vibrate and alphanumeric display facilities.

**Test Of:** Multitone Electronics plc.  
TLA 852/FLA872 Receiver  
**To:** FCC Part 15: 2001 Class B

---

**2.3. Modifications Incorporated In EUT**

No physical changes have been made to the EUT build, but the operating software has been adjusted to a “test mode” which allows for “continuous calling” with a faster reset cycle time, in order to more easily assimilate worst case EMC conditions.

**2.4. Additional Information Related To Testing**

<b>Power Supply Requirement:</b>	Internal battery supply of 1.5 V nominal
<b>Intended Operating Environment:</b>	Domestic, Office & Light Industrial, Industrial, Hospital
<b>Weight:</b>	60 g
<b>Dimensions:</b>	75 x 48 x 17 mm
<b>Interface Ports:</b>	None

## **2.5. Support Equipment**

The following support equipment was used to exercise the EUT during testing:

<b>Description:</b>	POCSAG Encoder		
<b>Brand Name:</b>	Multitone		
<b>Model Name or Number:</b>	P645		
<b>Serial Number:</b>	3830:01		
<b>FCC ID Number:</b>	Not applicable

**Support Equipment (Continued)**

<b>Description:</b>	Personal Computer
<b>Brand Name:</b>	Compaq
<b>Model Name or Number:</b>	Armada 1120
<b>Serial Number:</b>	7633HYC33258
<b>FCC ID Number:</b>	CNT75MB2CE
<b>Cable Length And Type:</b>	1.5 m, 7 Core Mouse Cable
<b>Connected to Port:</b>	Mouse Port

<b>Description:</b>	AC/DC Adapter; 110 V – 240 V AC to 16.5 V DC	
<b>Brand Name:</b>	Compaq	
<b>Model Name or Number:</b>	Series 2862	
<b>Serial Number:</b>	1544017463T

### **3. Test Specification, Methods And Procedures**

#### **3.1. Test Specification**

<b>Reference:</b>	FCC Part 15: 2001 Class B
<b>Title:</b>	Code of Federal Regulations, Part 15 (47CFR15) Radio Frequency Devices: Digital Devices.
<b>Comments:</b>	A description of the test facility used for this test is on file with, and has been accepted by, the Federal Communications Commission as required by Section 2.948 of Federal Rules.
<b>Purpose of Test:</b>	To determine whether the equipment complies with the requirements of the specification to achieve the relevant approval.

#### **3.2. Methods And Procedures**

The methods and procedures used were as detailed in:

ANSI C63.2 (1996)

Title: American National Standard for Instrumentation - Electromagnetic noise and field strength.

ANSI C63.4 (2001)

Title: American National Standard Methods of Measurement of Electromagnetic Emissions from Low Voltage Electrical and Electronic Equipment in the Range of 9 kHz to 40 GHz.

ANSI C63.5 (1998)

Title: American National Standard for the Calibration of antennas used for Radiated Emission measurements in Electromagnetic Interference (EMI) control.

ANSI C63.7 (1988)

Title: American National Standard Guide for Construction of Open Area Test Sites for performing Radiated Emission Measurements.

CISPR 16-1 (1999)

Title: Specification for radio disturbance and immunity measuring apparatus and methods. Part 1. Radio disturbance and immunity measuring apparatus.

#### **3.3. Definition Of Measurement Equipment**

The measurement equipment used complied with the requirements of the standards referenced in the Methods & Procedures section above. Appendix 1 contains a list of the test equipment used.

## **5. Operation Of The EUT During Testing**

### **5.1. Operating Conditions**

The EUT was tested in a normal laboratory environment.

### **5.2. Operating Modes**

The EUT was continually paged from the support equipment and, therefore, continually receiving, decoding and displaying paging calls.

### **5.3. Configuration And Peripherals**

The EUT was tested as a standalone unit.

## **7. Measurements, Examinations And Derived Results**

### **7.1. General Comments**

7.1.1. This section contains test results only. Details of the test methods and procedures can be found in Appendix 2 of this report.

7.1.2. Measurement uncertainties are evaluated in accordance with current best practice. Our reported expanded uncertainties are based on standard uncertainties, which are multiplied by an appropriate coverage factor to provide a statistical confidence level of approximately 95%. Please refer to Section 8 for details of measurement uncertainties.

## **7.2. Radiated Emissions**

### **7.2.1. Electric Field Strength Measurements (30 MHz to 1000 MHz)**

7.2.1.1. Plots of the initial scans can be found in Appendix 4.

7.2.1.2. Measurements were performed at a test distance of 10 metres. The measured value was then corrected to the required 3 metre test distance using the formula  $20\log(D1/D2)$  where D1 was 10 metres and D2 was 3 metres i.e. by 10.5 dB (refer to Part 15.31(f)(1)).

7.2.1.3. Measurements were performed on three samples of the EUT set to receive near the bottom, middle and top of the frequency range that the EUT is intended to operate in (as specified in Part 15.31(m)).

7.2.1.4. The following table lists frequencies at which emissions were measured using a Quasi-Peak detector (results incorporate antenna factors and cable losses):

#### **Sample #1 Serial No: 001413N:01**

### **7.2.2. Electric Field Strength Measurements (1 GHz to 2 GHz)**

7.2.2.1. The client has stated that the highest operating frequency for the EUT was 169.2 MHz. Therefore tests were performed up to 2.0 GHz.

7.2.2.2. Plots of the initial scans can be found in Appendix 4.

7.2.2.3. Measurements were performed on three samples of the EUT set to receive near the bottom, middle and top of the frequency range that the EUT is intended to operate in (as specified in Part 15.31(m)).

7.2.2.4. The following tables list frequencies at which emissions were measured using Peak and Average detector functions:

## **8. Measurement Uncertainty**

8.1. No measurement or test can ever be perfect and the imperfections give rise to error of measurement in the results. Consequently, the result of a measurement is only an approximation to the value of the measurand (the specific quantity subject to measurement) and is only complete when accompanied by a statement of the uncertainty of the approximation.

8.2. The expression of uncertainty of a measurement result allows realistic comparison of results with reference values and limits given in specifications and standards.

8.3. The uncertainty of the result may need to be taken into account when interpreting the measurement results.

8.4. The reported expanded uncertainties below are based on a standard uncertainty multiplied by an appropriate coverage factor, such that a confidence level of approximately 95% is maintained. For the purposes of this document “approximately” is interpreted as meaning “effectively” or “for most practical purposes”.

<b>Measurement Type</b>	<b>Range</b>	<b>Confidence Level</b>	<b>Calculated Uncertainty</b>
Radiated Emissions at 10 metres	30 MHz to 1000 MHz	95%	+/- 5.1 dB
Radiated Emissions	1 GHz to 18 GHz	95%	+/- 4.18 dB

8.5. The methods used to calculate the above uncertainties are in line with those recommended within the various measurement specifications. Where measurement specifications do not include guidelines for the evaluation of measurement uncertainty, the published guidance of the appropriate accreditation body is followed.

## **Appendix 2. Measurement Methods**

### **A2.1. Radiated Emissions**

A2.1.1. Radiated emissions measurements were performed in accordance with the standard, against appropriate limits for each detector function.

A2.1.2. Initial measurements covering the entire measurement band in the form of swept scans in a shielded enclosure were performed in order to identify frequencies on which the EUT was generating interference. This determined the frequencies on which the EUT should be re-measured in full on the open area test site. In order to minimise the time taken for the swept measurements, a Peak detector was used in conjunction with the appropriate detector IF measuring bandwidth (see table below). Repetitive scans were performed to allow for emissions with low repetition rates, and for the duty cycle of the EUT. The test configuration was the same for the initial scans as for the final measurements.

A2.1.3. The initial scans were performed using an antenna height of 1.5 m and a measurement distance of 3 m. Following the initial scans, graphs were produced giving an overview of the emissions from the EUT plotted against the appropriate specification limit. A tolerance line was set 6 dB below the specification limit and levels above the tolerance line were re-tested on the open area test site, at the appropriate distance, using a measuring receivers with a Quasi-Peak detector (below 1000 MHz), where applicable, for measurements above 1000 MHz average and peak detectors were used.

**Test Of:** Multitone Electronics plc.  
TLA 852/FLA872 Receiver  
**To:** FCC Part 15: 2001 Class B

---

A2.1.4. For the main (final) measurements the EUT was arranged on a non-conducting table on an open area test site, as detailed in the specification.

A2.1.5. All measurements on the open area test site were performed using broadband antennas.

A2.1.6. On the open area test site, at each frequency where a signal was found, the levels were maximised by initially rotating the turntable through 360° and then varying the antenna height between 1 m and 4 m. At this point, any signals found to be between the limit and a level 6 dB below it were further maximised by changing the configuration of the EUT, e.g. re-routing cables to peripherals and moving peripherals with respect to the EUT.

A2.1.7. The test equipment settings for radiated emissions measurements were as follows:

<b>Receiver Function</b>	<b>Initial Scan</b>	<b>Final Measurements Below 1GHz</b>	<b>Final Measurements Above 1 GHz</b>
Detector Type:	Peak	Quasi-Peak (CISPR)	Peak/Average
Mode:	Max Hold	Not applicable	Not applicable
