Notes:

(1) ** linear interpolations

[Where F is the frequency in MHz, the formulas for calculating the maximum permitted fundamental field strengths are as follows: for the band 130-174 MHz, $\mu\text{V/m}$ at 3 meters = $56.81818(F) - 6136.3636$; for the band 260-470 MHz, $\mu\text{V/m}$ at 3 meters = $41.6667(F) - 7083.3333$. The maximum permitted unwanted emission level is 20 dB below the maximum permitted fundamental level.]

The limits on the field strength of the spurious emissions in the above table are based on the fundamental frequency of the intentional radiator. Spurious emissions shall be attenuated to the average (or, alternatively, CISPR quasi-peak) limits shown in this table or to the general limits shown in 93 Section 15.209, whichever limit permits a higher field strength.

Spectrum Parameter	Setting
Attenuation	Auto
Start Frequency	1000 MHz
Stop Frequency	10th carrier harmonic
RB / VB (emission in restricted band)	1MHz / 1MHz for Peak

Receiver Parameter	Setting
Attenuation	Auto
Start ~ Stop Frequency	9kHz~150kHz / RB 200Hz for QP
Start ~ Stop Frequency	150kHz~30MHz / RB 9kHz for QP
Start ~ Stop Frequency	30MHz~1000MHz / RB 90kHz for QP

9.3 TEST PROCEDURE

The test site semi-anechoic chamber has met the requirement of NSA tolerance 4 dB according to the standards: ANSI C63.10-2013. The test distance is 3m. The setup is according to the requirements in Section 13.1.4.1 of ANSI C63.10-2013 and CAN/CSA-CEI/IEC CISPR 22.

This test is required for any spurious emission that falls in a Restricted Band, as defined in Section 15.205. It must be performed with the highest gain of each type of antenna proposed for use with the EUT.

Use the following spectrum analyzer settings:

Spectrum Parameter	Setting
Attenuation	Auto
Start Frequency	1000 MHz
Stop Frequency	10th carrier harmonic
RB / VB (emission in restricted band)	1 MHz / 1 MHz for Peak, 1 MHz / 10Hz for Average

Receiver Parameter	Setting
Attenuation	Auto
Start ~ Stop Frequency	9kHz~150kHz / RB 200Hz for QP
Start ~ Stop Frequency	150kHz~30MHz / RB 9kHz for QP
Start ~ Stop Frequency	30MHz~1000MHz / RB 120kHz for QP

- The measuring distance of at 3 m shall be used for measurements at frequency up to 1GHz. For frequencies above 1GHz, any suitable measuring distance may be used.
- The EUT was placed on the top of a rotating table 0.8 m for below 1GHz and 1.5m for above 1GHz the ground at a 3 meter. The table was rotated 360 degrees to determine the position of the highest radiation.
- The height of the equipment or of the substitution antenna shall be 0.8 m for below 1GHz and 1.5m for above 1GHz; the height of the test antenna shall vary between 1 m to 4 m. Both horizontal and vertical polarizations of the antenna are set to make the measurement.
- For the radiated emission test above 1GHz:
Place the measurement antenna away from each area of the EUT determined to be a source of emissions at the specified measurement distance, while keeping the measurement antenna aimed at the source of emissions at each frequency of significant emissions, with polarization oriented for maximum response. The measurement antenna may have to be higher or lower than the EUT, depending on the radiation pattern of the emission and staying aimed at the emission source for receiving the maximum signal. The final measurement antenna elevation shall be that which maximizes the emissions. The measurement antenna elevation for maximum emissions shall be restricted to a range of heights of from 1 m to 4 m above the ground or reference ground plane.
- The initial step in collecting conducted emission data is a spectrum analyzer peak detector mode pre-scanning the measurement frequency range. Significant peaks are then marked and then Quasi Peak detector mode re-measured.
- If the Peak Mode measured value compliance with and lower than Quasi Peak Mode Limit, the EUT shall be deemed to meet QP Limits and then no additional QP Mode measurement performed.
- For the actual test configuration, please refer to the related Item –EUT Test Photos.

Note:

Both horizontal and vertical antenna polarities were tested and performed pretest to three orthogonal axis. The worst case emissions were reported

During the radiated emission test, the Spectrum Analyzer was set with the following configurations:

Frequency Band (MHz)	Function	Resolution bandwidth	Video Bandwidth
30 to 1000	QP	120 kHz	300 kHz
Above 1000	Peak	1 MHz	1 MHz
	Average	1 MHz	10 Hz

Note: for the frequency ranges below 30 MHz, a narrower RBW is used for these ranges but the measured value should add a RBW correction factor (RBWCF) where $RBWCF [dB] = 10 \cdot \lg(100 [kHz] / \text{narrower RBW [kHz]})$. , the narrower RBW is 1 kHz and RBWCF is 20 dB for the frequency 9 kHz to 150 kHz, and the narrower RBW is 10 kHz and RBWCF is 10 dB for the frequency 150 kHz to 30 MHz.

2. *Calculate Average value based on Duty Cycle correction factor:

$$\text{Duty Cycle1} = \text{Ton}/(\text{Ton} + \text{Toff}) = (0.52 \times 10)/38.80 = 0.134 = 13.4\%$$

$$\text{Duty Cycle factor1} = 20\lg(\text{Duty Cycle}) = 20\lg(0.134) = -17.46$$

$$\text{Duty Cycle2} = \text{Ton}/(\text{Ton} + \text{Toff}) = (0.52 \times 5 + 1.53 \times 5)/38.72 = 0.2647 = 26.47\%$$

$$\text{Duty Cycle factor2} = 20\lg(\text{Duty Cycle}) = 20\lg(0.2647) = -11.54$$

$$\text{Duty Cycle3} = \text{Ton}/(\text{Ton} + \text{Toff}) = (1.52 \times 10)/38.96 = 0.3901 = 39.01\%$$

$$\text{Duty Cycle factor3} = 20\lg(\text{Duty Cycle}) = 20\lg(0.3901) = -8.18$$

$$\text{Average} = \text{Peak} + \text{Duty Cycle factor}$$

$$2. \text{ FCC Limit for Average Measurement} = 41.6667(300) - 7083.3333 = 5416.677 \mu\text{V/m}$$

=74.67dBuV/m

3. Pulse Desensitization Correction Factor

Pulse Width(PW)= 38.72ms

$2/PW=2/38.72\text{ms}=0.052\text{kHz}$

$RBW(100\text{kHz}) > 2/PW (0.052\text{kHz})$,

Therefore PDCF is not needed.

Duty Cycle1:

The duty cycle is simply the on time divided by the period:

The duration of one cycle = 38.80ms

$T_{ON(\text{one hop})1}=0.52\text{ms}$

Effective period of the cycle = $0.52 \times 10 = 5.2\text{ms}$,

Duty Cycle = $5.2\text{ms}/38.80\text{ms} = 0.134 = 13.4\%$

Duty Cycle2:

The duty cycle is simply the on time divided by the period:

The duration of one cycle = 38.72ms

$T_{ON(\text{one hop})1}=1.53\text{ms}$ $T_{ON(\text{one hop})2}=0.52\text{ms}$

Effective period of the cycle = $0.52 \times 5 + 1.53 \times 5 = 10.25\text{ms}$,

Duty Cycle = $10.25\text{ms}/38.72\text{ms} = 0.2647 = 26.47\%$

Duty Cycle3:

The duty cycle is simply the on time divided by the period:

The duration of one cycle = 38.96ms

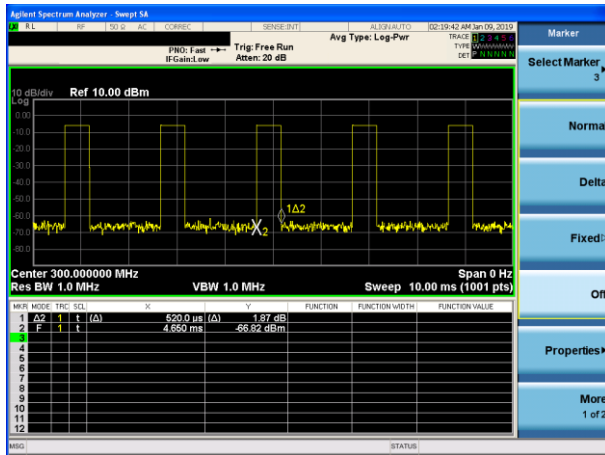

$T_{ON(\text{one hop})1}=1.52\text{ms}$

Effective period of the cycle = $1.52 \times 10 = 15.2\text{ms}$,

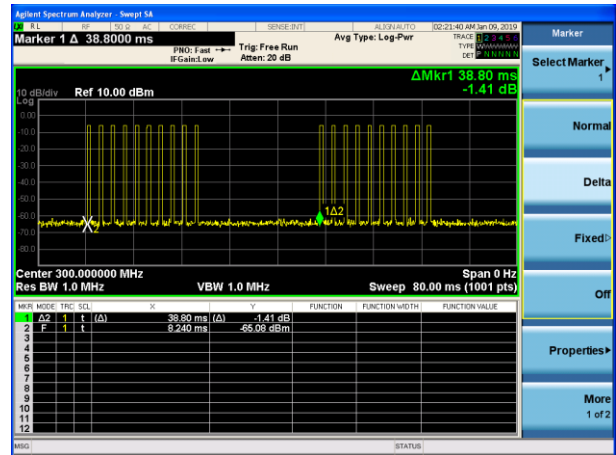

Duty Cycle = $15.2\text{ms}/38.96\text{ms} = 0.3901 = 39.01\%$

10. BANDWIDTH TEST

10.1 TEST PROCEDURE

The bandwidth of the emission shall be no wider than 0.25% of the center frequency for devices operating above 70 MHz and below 900 MHz. For devices operating above 900 MHz, the emission shall be no wider than 0.5% of the center frequency. Bandwidth is determined at the points 20 dB down from the modulated carrier.

Limit: $300\text{MHz} \times 0.25\% = 750\text{KHz}$

10.2 DEVIATION FROM STANDARD

No deviation.

11. TRANSMITTER TIMEOUT

11.1 REQUIREMENTS

- | | |
|---|---|
| 1 | A manually operated transmitter shall employ a switch that will automatically deactivate the transmitter within not more than 5 seconds of being released.
Result: The EUT is a manually activated transmitter, press 5 seconds will automatically stop working |
| 2 | A transmitter activated automatically shall cease transmission within 5 seconds after activation.
Result: The EUT is a manually activated transmitter, press 5 seconds will automatically stop working |
| 3 | Periodic transmissions at regular predetermined intervals are not permitted. However, polling or supervision transmissions, including data, to determine system integrity of transmitters used in security or safety applications are allowed if the total duration of transmissions does not exceed more than two seconds per hour for each transmitter. There is no limit on the number of individual transmissions, provided the total transmission time does not exceed two seconds per hour
Result: The EUT does not employ periodic transmission. |
| 4 | Intentional radiators which are employed for radio control purposes during emergencies involving fire, security, and safety of life, when activated to signal an alarm, may operate during the pendency of the alarm condition.
Result: The section is not applicable to EUT. |
