Dear Examiner:

The following application for Grant of Equipment Authorization is presented on behalf of Repeater Technologies for the Licensed Certification of their Model: OfficeCell PCS1900.

Enclosed, please find a complete data and documentation package demonstrating that this device complies with the technical requirements of 47 CFR, Part 24, for a PCS Repeater.

If you have any questions, please contact the undersigned, who is authorized to act as Agent.

Sincerely,

Chris Harvey  
Director, EMC Laboratory

## ENGINEERING STATEMENT

**I ATTEST:** the measurements shown in this report were made in accordance with the procedures indicated, and that the emissions from this equipment were found to be within the limits applicable. I assume full responsibility for the accuracy and completeness of these measurements. On the basis of the measurements made, the equipment tested is capable of operation in accordance with the requirements of Part 24 of the FCC Rules under normal use and maintenance.

EMC Engineer, MET Laboratories

## 1.0 INTRODUCTION

The following data is presented on behalf of the Applicant, Repeater Technologies, as verification of the compliance of the Repeater Technologies OfficeCell PCS1900 to the requirements of 47CFR 24.

## 2.0 TEST SITE

All testing was conducted at MET Laboratories, Inc., 914 West Patapsco Avenue, Baltimore, Maryland 21230-3493. Radiated emissions measurements were performed on a three-meter open area test site (OATS). A complete site description is on file with the FCC Laboratory Division as 31040/SIT/MET.

## 4.0 EQUIPMENT UNDER TEST CONFIGURATION

The PCS Repeater was configured with AC power supply modules and a digital signal generator was used to simulate various CDMA (i.e. QPSK Modulation type),NADC (DAMPS) and GSM. cellular RF input signals to the EUT. The EUT with host external computer was configured for maximum signal gain and bandwidth. The EUT was operated in a manner representative of the typical usage of the equipment. During all testing, system components were manipulated within the confines of typical usage to maximize each emission.

## 5.0 TEST TYPE(S)

- 5.1 Radiated Emissions: 47 CFR 2.1053, 24.238
- 5.2 Occupied Bandwidth: 47 CFR 2.1049, Input vs. Output
- 5.3 RF Power Output: 47 CFR 2.1046, 24.132(b)(c)
- 5.4 Spurious Emission at Antenna Terminals (uplink & downlink): 47 CFR 2.1051, 24.238(a)
- 5.5 Intermodulation Spurious Emissions-2 Tone Simultaneous RF Injection (uplink & downlink) at the lowest and highest sides of the band: 47 CFR 2.1051.
- 5.6 AC Line Conducted Emissions: 47 CFR 15.107

## 6.0 TEST RESULTS

### 6.1 TEST TYPE: Radiated Emissions

#### 6.1.1 TECHNICAL SPECIFICATION: 47 CFR 2.1053; 24.238

#### 6.1.2 TEST DATE(S): August 10, 2000

#### 6.1.3 MEASUREMENT PROCEDURES:

As required by §2.1053, *field strength of spurious radiation measurements* were made in accordance with the general procedures of ANSI C63.4-1992 "Methods of Measurement of Radio-Noise Emissions from Low-Voltage Electrical and Electronic Equipment in the Range of 9kHz to 40 GHz". Preliminary and final radiated emission measurements were performed inside a semi-anechoic chamber with all digital signal generators on and . The frequency list from the preliminary measurements was used as a guide for making final measurements in the semi-anechoic chamber. The unit was scanned over the frequency range of 30MHz to 20 GHz.

The Radiated Spurious Emissions *Limit* is obtained by the following:

Based on an output power (as measured at the output of the Amplifier) of 0.22 watts:

$$P_o = 0.22 \text{ W}$$

As per 2.993 (a), it is assumed this power is to be fed to a half-wave tuned dipole. Using a conversion formula for distance, the field strength at one meter can be derived:

$$E(V/m)_{1m} = \frac{\sqrt{49.2 \times 0.22}}{1}$$
$$E(V/m)_{1m} = 3.29 \text{ V/m or } 130.5 \text{ dB}\mu\text{V}$$

As per 22.917(e), the spurious emissions must be attenuated by  $43 + 10\log(P)$  which is:

$$43 + 10\log(0.22) = 36.424 \text{ dB}$$

Therefore, the limit for spurious emissions is:

$$130.5 \text{ dB}\mu\text{V} - 36.424 \text{ dB} = 94 \text{ dB}\mu\text{V} @ 1m$$

At 3 meters measurement distance, the limit is;

$$E(V/m)_{3m} = \frac{\sqrt{49.2 \times 0.22}}{3}$$
$$E(V/m)_{3m} = 1.0967 \text{ V/m or } 120.5 \text{ dB}\mu\text{V}$$

According to 22.917(e), all signals must be attenuated by 49 dB. Therefore, the limit for spurious emissions for a test distance of 3 meters is:

$$120.5 - 36.424 = 84 \text{ dB}\mu\text{V} @ 3m$$

**6.2.1 TECHNICAL SPECIFICATION:** 47 CFR 2.1049

**6.2.2 TEST DATE(S):** September 1 , 2000

**6.2.3 MEASUREMENT PROCEDURES:**

As required by §2.1049 of CFR 47, *occupied bandwidth measurements* were made on the PCS Repeater pre- and post- repeater. A digital signal generator was configured to transmit a modulated carrier signal. Using a bandwidth of 300Hz for NADC and 1-30 kHz for GSM and CDMA (digital).

**6.2.4 RESULTS:**

Equipment complies with Section 2.1049. Plots of the occupied bandwidth, as measured at the Repeater/Booster RF input port and at the antenna RF output port (post amplification) follow:

#### **6.3.2 TEST DATE(S): August 31, 2000**

#### **6.3.3 MEASUREMENT PROCEDURES:**

As required by 47 CFR 2.1046, *RF power output measurements* were made at the RF output terminals using an attenuator and spectrum analyzer.

Plots of the RF output Power level, as measured at the RF output of the signal generator and at the RF output terminals of the EUT are included in this application as file attachment

#### **6.3.4 RESULTS:**

Equipment complies with 47 CFR 2.1046 and 24.132(b)(c). The Cellular repeater/booster power does not exceed 500 W (57 dBm) at the carrier frequency.

#### **6.4 TEST TYPE: Spurious Emissions at Antenna Terminals— Uplink Channels**

##### **6.4.1 TECHNICAL SPECIFICATION: 47 CFR 2.1051; 24.238(a)**

##### **6.4.2 TEST DATE(S): August 31, 2000**

##### **6.4.3 MEASUREMENT PROCEDURES:**

As required by 47 CFR 2.1051, *spurious emissions at antenna terminal measurements* were made at the RF output terminals using a 50  $\Omega$  attenuator and spectrum analyzer set for a 100 kHz bandwidth. This test was performed with Digitally modulated carrier signals. The Digital signal generator was adjusted for continuous transmit on frequencies in both the uplink and down-link frequency bands. The frequency spectrum was investigated from 9.0 KHz to 20 GHz. For measuring emissions above 2 GHz, a high-pass filter was used to eliminate the fundamental transmit frequency to prevent possible saturation effects on the front end of the spectrum analyzer.

##### **6.4.4 RESULTS:**

Equipment complies with Sections 2.1051 and 24.238(a)

As recommended in 47 CFR 24.238(a), a 100kHz bandwidth was chosen to measure the peak of any spurious emission. The unit was exercised using signal types required by 47 CFR 2.1051.

Spur limit =  $P_o - (43 + 10\log P) = 132.5 \text{ dB}\mu\text{V} - (38.44 \text{ dB}) = 94 \text{ dB}\mu\text{V} = -13.1 \text{ dBm}$
