**1. TEST SUMMARY****Test Report No.:**

W980831

Company:

Itron, Inc.

Requester:

Klaus Bender

Phone:

(509) 891-3323

Test Date(s):

August 26, 27, 28 & 31, 1998

Equipment Under Test:

Utility Meter Transceiver

General Test Summary:

The 40GN ERT® transmitter was tested for compliance to FCC Part 15.249 requirements for an intentional radiator. The receiver was tested for compliance to FCC Part 15.109.

**Original Grant or
Permissive Change:**

Original Grant

Certification Status:

The 40GN ERT transmitter has been verified as being compliant with the FCC Part 15.249 requirements for an intentional radiator. The receiver has been verified as being compliant with the FCC Part 15.109 requirements for receivers.

Modifications**Necessary for Compliance:**

None. See Section 2. For EUT description.

Tested By: Robert A. Sleen**Report Written By:** Robert A. Sleen

2. PRODUCT DESCRIPTION AND TEST OBJECTIVE

The EUT is an utility meter transceiver and is used in conjunction with a host meter to measure natural gas consumption. The EUT transmits consumption data if the receiver detects a wake-up tone. (See Sections 6 and 7 for test set-up description). The 40GN ERT® has a wide band receiver centered at 955 MHz. The actual fundamental receiver frequency is set at the time of manufacture. The unit also has a frequency-hopping transmitter that operates over a maximum 6 MHz bandwidth in the 910-920 MHz band (the actual fundamental frequency is set at the time of manufacture). The objective of this test is to determine if the EUT transmitter meets the radiated emission levels established by FCC Part 15.249 for intentional radiators and to determine if the EUT receiver meets the radiated emission levels established by FCC Part 15.109 for unintentional radiators. The EUT was tested at an antenna to EUT distance of 3 meters according to ANSI C63.4-1992.

3. TEST FACILITY

The tests were performed at the test facility of Itron, Inc. located at 2401 North State Street, Waseca, Minnesota 56093. This site is fully described in a document submitted to the FCC and accepted in a letter dated June 12, 1996 (Ref.: 31040/SIT 1300F2).

4. EUT SUPPORT EQUIPMENT USED:

Test Equipment	Model	Manufacturer	Serial. No.	Radiated or Conducted EMI	Cal. Due
RF Signal Generator	8656A	Hewlett Packard	2341A05541	R & C	N/A
Function Generator	171	Wavetek	M6230187	R & C	N/A
Double Ridged Guide Antenna	3115	EMCO	9508-4550	R & C	N/A

5. EUT SYSTEM DESCRIPTION:

The EUT was physically configured similar to a typical user configuration. The EUT was placed in the center of the test table 80 cm above the ground plane.

There were no associated components or accessories on the table during the radiated emissions tests.

6. OPERATING MODE OF EUT, SOFTWARE/FIRMWARE ETC. :

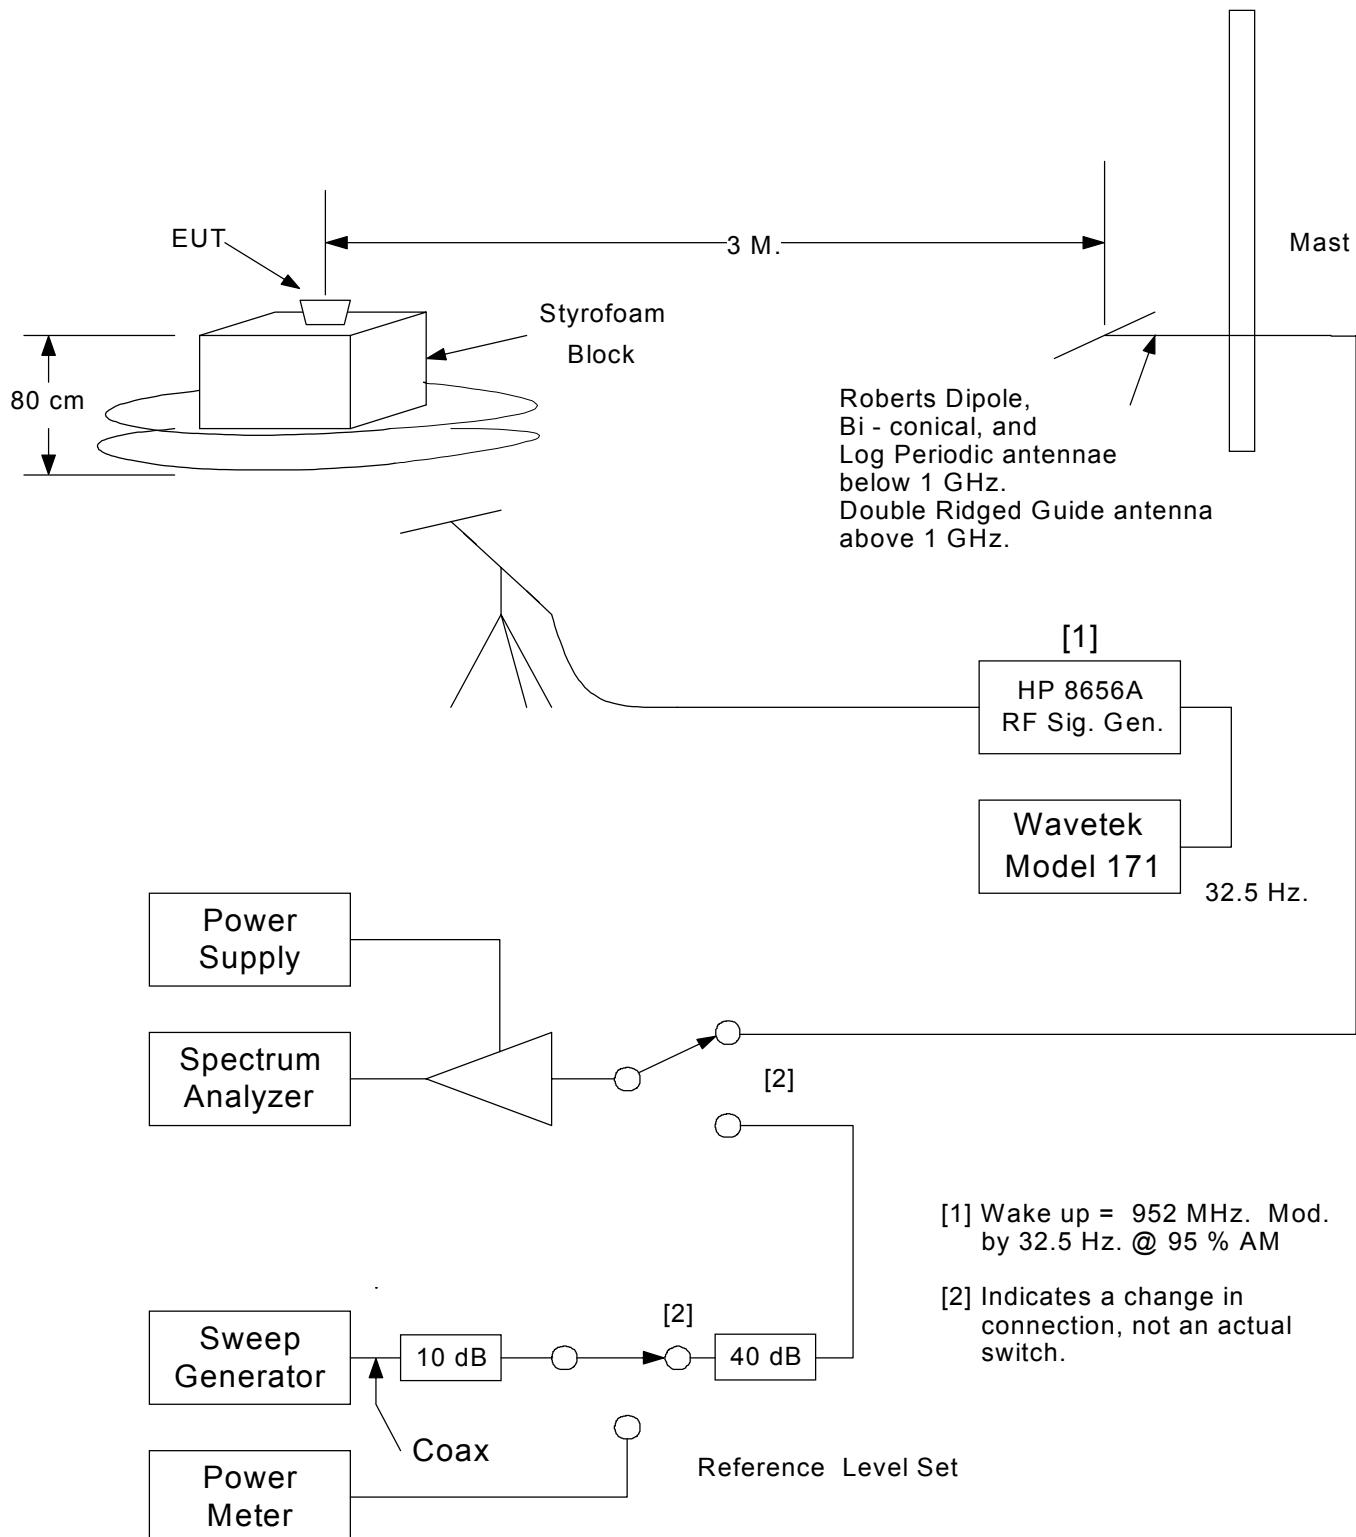

The EUT was operationally configured to a special test mode. This special test mode causes the ERT® to transmit consecutive messages, thus allowing peaks of transmitter radiation to be more easily found as antenna heights and turntable azimuth are varied.

The hopping bandwidth of the transmitter is in the range of 1.5 to 6.0 MHz including manufacturing and component variability.

See Attachment B for message detail.

The receiver was under normal operation (a 0.3 usec. maximum wide on-time pulse occurring at a 512 HZ rate).

See the test set-up diagram in Section 7 and the photos in Attachment E.

12. DESCRIPTION OF TEST PROCEDURE

12.1 Radiated Emissions (Transmitter and Receiver)

These tests measure the transmitter radiated emissions and the receiver radiated emissions using a spectrum analyzer and receiving antenna. During testing the EUT was placed on a non-conducting support, 80 cm above the ground plane. The RF spectrum was scanned from 30 MHz to 1000 MHz using the Bi-conical and Log Periodic antennae. A Double Ridged Guide antenna was used from 1 GHz to the product's tenth harmonic of the transmitter (9.1315 GHz) and 5 GHz on the receiver. Levels below 1 GHz were measured with the spectrum analyzer resolution bandwidth at 120 kHz and levels at or above 1 GHz were measured with the spectrum analyzer resolution bandwidth at 1 MHz for the transmitter and 1 MHz for the receiver. The receiver harmonics were also checked with the spectrum analyzer at the following settings: Resolution Bandwidth = 1 MHz; Video Bandwidth = 10 Hz and Span = 0 Hz. The emissions were measured with vertical and horizontal antenna polarizations. The antenna height was varied from 1-4 meters and the EUT was rotated from 0-360°. Maximum emissions were recorded. The antenna to EUT test distance was 3 meters horizontally. An analog spectrum analyzer was used as an aid in locating the maximum radiation emission as the EUT orientation and antenna position were varied. The level was determined on the HP8593E by means of signal substitution. Testing was performed according to the procedures in ANSI C63.4-1992.

13. RESULTS

13.1 Radiated Emissions (Transmitter and Receiver)

Final emission levels are expressed in dB_{UV}/m. This level is determined by converting the reading from the spectrum analyzer or power meter to dB_{UV} and adding the antenna correction factor (dB) and cable loss (dB) to it. The amplifier gain is accounted for when the spectrum analyzer display is calibrated. Antenna and cable loss factors are included in the tabular results contained in Attachment A. All levels below 1 GHz are quasi-peak with the exception of the transmitter fundamental. The transmitter fundamental is expressed in peak level as it is below the quasi-peak limit. Transmitter final levels of frequencies above 1 GHz are peak average with a 20 dB relaxation allowed for duty cycle.

Refer to Attachment B for duty cycle calculation.

Refer to Attachment E for pulse desensitization of the spectrum analyzer calculations.

13.1.1 Transmitter Radiated Emissions

RULE:

Part 15.249: Emission of RF Energy - Transmitter

STANDARD:

Part 15.33 (a)(1) Frequency range of the radiated measurements:

Tenth harmonic of the highest fundamental frequency.

Part 15.249

Field Strength of Fundamental Frequency: 50,000 uV/m (94 dBuV/m)
 Field Strength of Harmonic Radiation: 500 uV/m (54 dBuV/m)

Field Strength of Spurious Radiation:

Part 15.249(c):

Emissions radiated outside the specified frequency bands, except for harmonics, shall be attenuated by at least 50 dB below the level of the fundamental or to the general radiation limits in 15.209, whichever is the lesser attenuation.

Part 15.209

Except as provided elsewhere in this subpart, the emissions from an intentional radiator shall not exceed the field strength levels specified in the following table:

Frequency of Emission (MHz)	Field Strength (uV/m)	Field Strength (dBuV/m)
30-88	100	40
88-216	150	43.5
216-960	200	46
Above 960	500	54

TEST RESULTS:

The EUT transmitter radiated emissions met the requirements established by FCC Part 15.249 for intentional radiators. The EUT was tested from 30 MHz to the transmitter's 10th harmonic (9.1315 GHz). No EUT transmitter emissions other than the fundamental at 913.15 MHz were detected in the range from 30 MHz to 1 GHz.

The transmitter fundamental (913.15 MHz) was measured to be 88.6 dBuV/m peak. This is 5.4 dB below the quasi-peak limits established by Part 15.249. The worst case harmonic radiated emission was determined to be 72.9 dBuV/m peak. The limit established by Part 15.249 and Part 15.35 (b) is 74 dBuV/m (conversion of instantaneous peak power to average power allows an additional 20 dB relaxation). The result is a margin of 1.1 dB.

In compliance with FCC Part 15.35 (b), conversion of instantaneous peak power to average power is addressed in Attachment B.

**TEST DATA:**

Refer to Attachment A for detailed test results

Refer to Attachment C for Part 15.31 (m); Measurement of Relative Field Intensity at the High and Low Frequencies of the EUT.

13.1.2 Receiver Radiated Emissions**RULE:**

Part 15.109: Radiated Emission Limits

STANDARD:

Part 15.33 (b)(1)

The upper frequency of measurement range: 5000 MHz.

Part 15.109 (a)

The field strength of radiated emissions from unintentional radiators at a distance of three meters shall not exceed the following values:

Frequency of Emission <u>(MHz)</u>	Field Strength <u>(uV/m)</u>	Field Strength <u>(dBuV/m)</u>
30-88	100	40
88-216	150	43.5
216-960	200	46
Above 960	500	54

TEST RESULTS:

The EUT receiver radiated emissions met the levels established by FCC Part 15.109 (a) requirements for receivers.

The EUT was tested from 30 MHz to 5000 MHz.

The receiver fundamental (950.7 MHz) was determined to be 36.4 dBuV/m quasi-peak. The limit established by Part 15.109 (a) is 46 dBuV/m. No EUT receiver emissions other than the fundamental at 950.7 MHz were detected in the range from 30 MHz to 1 GHz.

The receiver second harmonic was determined to be 39.3 dBuV/m.

Duty cycle calculation for Pulsed RF per FCC Part 15.35 (b) is addressed in Attachment B.

TEST DATA:

Refer to Attachment A for detailed test results

EFTRON**ATTACHMENT B****Conversion from Instantaneous Peak Power to Average Power
40GN ERT®**

The ERT Unit Transmits a sequence of eight Manchester Encoded Messages in a ten second Period. Each of the messages are 5.86 msec long. Each message is broadcast on a different frequency within the Transmit Band.

Zooming in on a message length;

Where bit rate is: 16.384 Kbits/Second.

During the transmission of eight messages, the Transmit Duty Cycle can be computed.

$$\% \text{ Duty Cycle Transmit} = (96 \text{ bits}) (1/16.384 \text{ Kbits/Sec}) (.5) (100\%) / (100 \text{ msec})$$

$$\% \text{ Duty Cycle Transmit} = 2.93 \%$$

Note: The .5 factor is a result of Manchester Encoded Data.

Expressing the correction factor for Duty Cycle in dB:

$$\text{dB Duty Cycle Transmit} = 20 \text{ Log} (\text{Duty Cycle})$$

$$\text{dB Duty Cycle Transmit} = 20 \text{ Log} (0.0293)$$

$$\text{dB Duty Cycle Transmit} = -30.7 \text{ dB}$$

During the receive mode, the Receiver Duty Cycle can be computed.

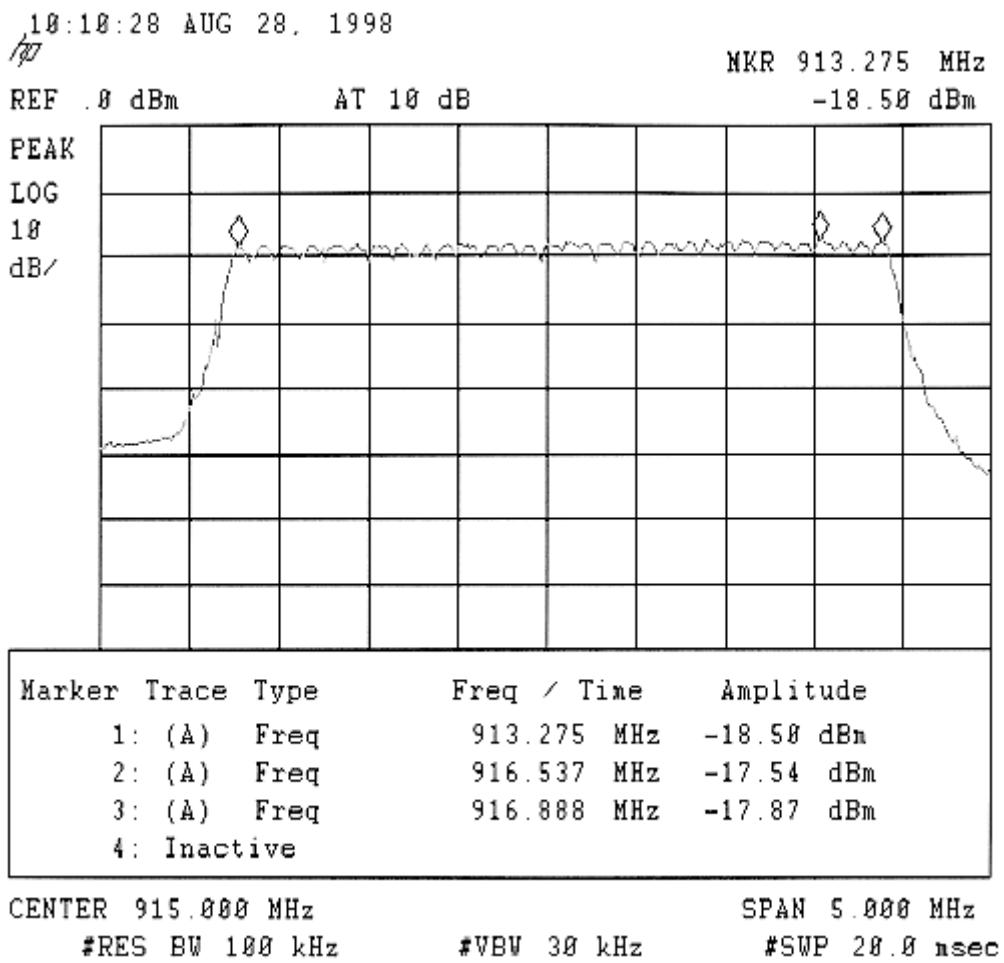

$$\% \text{ Duty Cycle Receive} = (0.3 \mu\text{sec.}) (512 \text{ Hz}) (100\%)$$

$$\% \text{ Duty Cycle Receive} = .01536 \%$$

Expressing the correction factor for Duty Cycle in dB:

$$\text{dB Duty Cycle Receive} = 20 \text{ Log} (1.536 * 10^{-4})$$

$$\text{dB Duty Cycle Receive} = -76.3$$

IFRON**ATTACHMENT C****Part 15.31(m)****Measurement of Relative Field Intensity at the High and Low Frequencies of the EUT.**

ATTACHMENT D

Pulse Desensitization of the Spectrum Analyzer

Pulse Desensitization of the Spectrum Analyzer is the rise time delay inherently imposed by the resolution bandwidth setting of the spectrum analyzer. The resulting attenuation of narrow pulse signals necessitates that a compensating factor be applied to the levels on the spectrum analyzer when peak levels are being measured.

This does not apply to Quasi-peak measurements.

Reference: Application Note 150-2 "Spectrum Analysis of Pulsed RF", Hewlett Packard, November 1971

Example:

$$PDSA = 20 \log (\text{Pulse width} \times 1.5 \times \text{Spectrum Analyzer Resolution Bandwidth})$$

$$PDSA = 20 \log (.15 \times 10^{-6} \times 1.5 \times 1 \times 10^6)$$

$$PDSA = -12.96 \text{ dB}$$

Pulse Desensitization of the Spectrum Analyzer
