TEST REPORT FOR

**Water Endpoint
Model: RIVAW**

Tested to The Following Standards:

**FCC Part 15 Subpart C
Section: 15.247
(FHSS 902-928 MHz)**

Report No.: 98804-13

Date of issue: August 31, 2016

This test report bears the accreditation symbol indicating that the testing performed herein meets the test and reporting requirements of ISO/IEC 17025 under the applicable scope of EMC testing for CKC Laboratories, Inc.

We strive to create long-term, trust based relationships by providing sound, adaptive, customer first testing services. We embrace each of our customers' unique EMC challenges, not as an interruption to set processes, but rather as the reason we are in business.

Report Authorization

The test data contained in this report documents the observed testing parameters pertaining to and are relevant for only the sample equipment tested in the agreed upon operational mode(s) and configuration(s) as identified herein. Compliance assessment remains the client's responsibility. This report may not be used to claim product endorsement by A2LA or any government agencies. This test report has been authorized for release under quality control from CKC Laboratories, Inc.

NP = CKC Laboratories was not contracted to perform test.

Modifications During Testing

This list is a summary of the modifications made to the equipment during testing.

Summary of Conditions

No modifications were made during testing.

Modifications listed above must be incorporated into all production units.

Conditions During Testing

This list is a summary of the conditions noted to the equipment during testing.

Summary of Conditions

Note: Emissions from both configurations was used to determine the emissions limit in accordance with 15.247(d). Some spurious emissions data >1GHz for GFSK mode was taken using configuration 1. All other data were taken using configuration 2. Emissions <1GHz for configuration 1 are not represented in this report.

EQUIPMENT UNDER TEST (EUT)

During testing numerous configurations may have been utilized. The configurations listed below support compliance to the standard(s) listed in the Summary of Results section.

Configuration 1

Equipment Tested:

Test Conditions / Notes:

EUT is a transmitter operating within 902-928 MHz. EUT is battery operated, fresh batteries installed. EUT has IO ports with cables attached. Middle port is for remote antenna and must be left open for testing integral antenna. Equipment installed according to manufacturer specifications. Equipment is configured for 10dBm output power with OOK modulation.

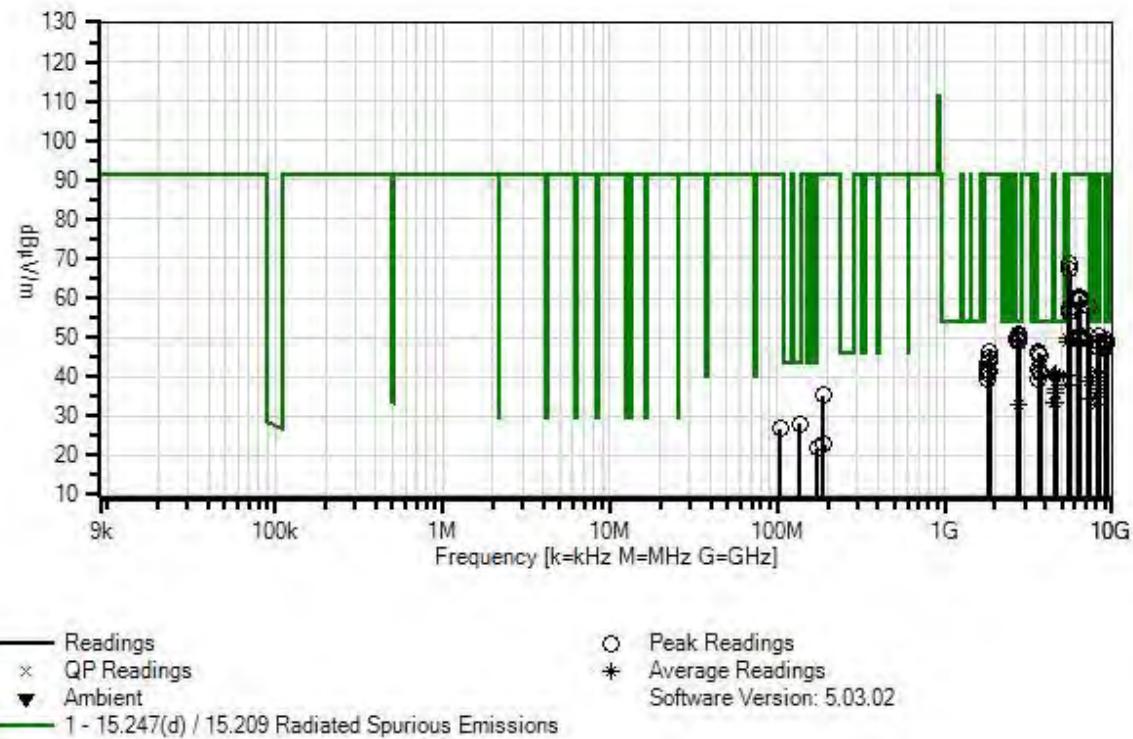

Test procedure: ANSI C63.10 (2013)

Frequency range investigated: 9kHz - 10GHz
 Transmitter Frequency: 903, 910, 915, 926.8 MHz.

No emissions detected within 20dB of the limit at frequencies <100MHz. See band edge emissions data for emissions near transmit band.

Emissions >1GHz where average measurements are employed utilized averaging only during periods when transmitter was on. Additionally, average measurements applied a duty cycle correction factor in accordance with 15.35(c) $20 \log(12.2\text{ms} * 100\text{ms}) = 18.3\text{db}$ relaxation.

 Customer: **Itron, Inc.**
 Specification: **15.247(d) / 15.209 Radiated Spurious Emissions**
 Work Order #: **98804** Date: 8/20/2016
 Test Type: **Maximized Emissions** Time: 02:08:16
 Tested by: Randal Clark Sequence#: 30
 Software: EMITest 5.03.02

Test Conditions / Notes:

EUT is a transmitter operating within 902-928 MHz. EUT is battery operated, fresh batteries installed. EUT has IO ports with cables attached. Middle port is for remote antenna and must be left open for testing integral antenna. Equipment installed according to manufacturer specifications.
 Equipment is configured for maximum output power with OOK modulation.

Test procedure: ANSI C63.10 (2013)

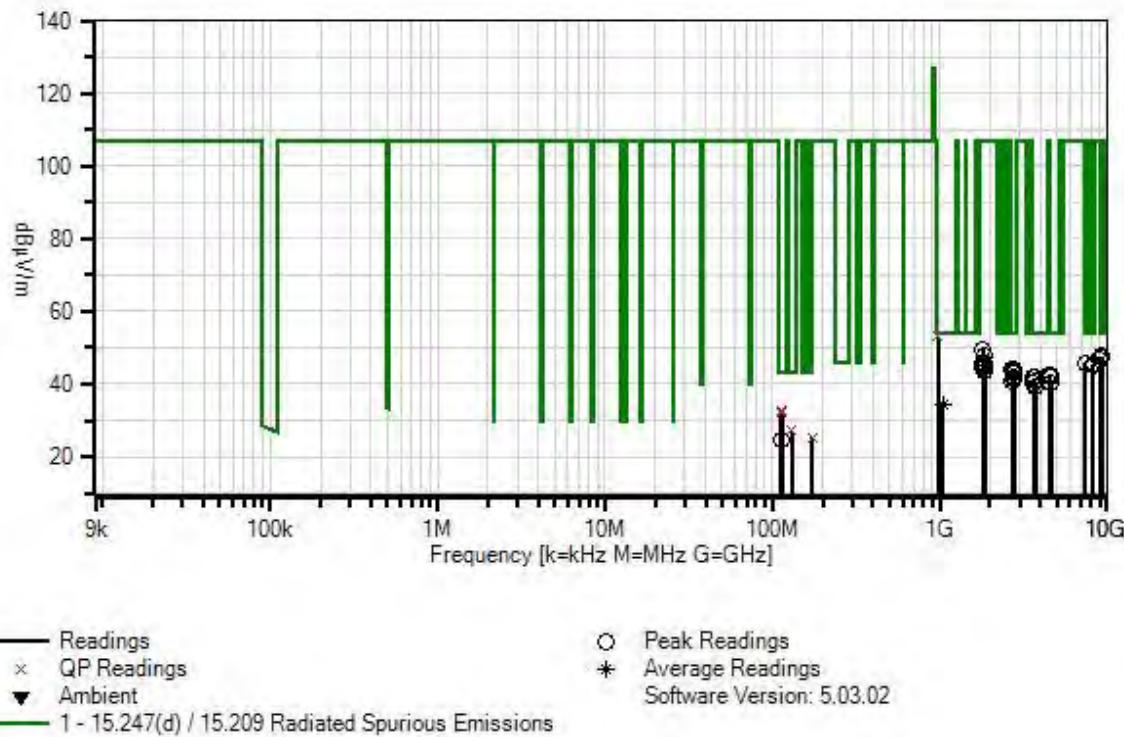

Frequency range investigated: 9kHz - 10GHz
 Transmitter Frequency: 903, 910, 915, 926.8 MHz.

No emissions detected within 20dB of the limit at frequencies <100MHz. See band edge emissions data for emissions near transmit band.

Temperature: 27°C

Relative Humidity: 34%

 Customer: **Itron, Inc.**
 Specification: **15.247(d) / 15.209 Radiated Spurious Emissions**
 Work Order #: **98804** Date: 8/20/2016
 Test Type: **Maximized Emissions** Time: 02:16:20
 Tested by: Randal Clark Sequence#: 31
 Software: EMITest 5.03.02

Test Conditions / Notes:

EUT is a transmitter operating within 902-928 MHz. EUT is battery operated, fresh batteries installed. EUT has IO ports with cables attached. Middle port is for remote antenna and must be left open for testing integral antenna. Equipment installed according to manufacturer specifications.
 Equipment is configured for maximum output power with GFSK modulation.

Test procedure: ANSI C63.10 (2013)

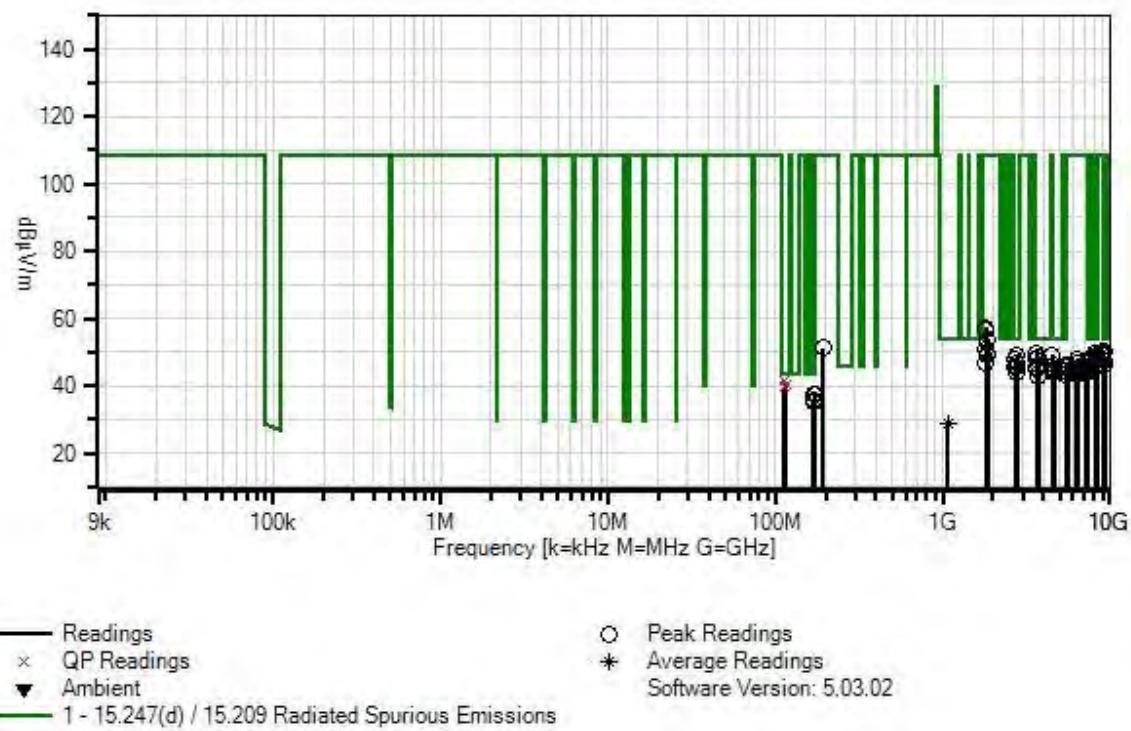

Frequency range investigated: 9kHz - 10GHz
 Transmitter Frequency: 902.4, 910, 915.2, 927.6 MHz.

No emissions detected within 20dB of the limit at frequencies <100MHz. See band edge emissions data for emissions near transmit band.

Temperature: 27°C
 Rel Humidity: 34%

Data taken using configuration 1 as noted below is representative for configuration 2 as determined during testing.
 All other data is taken using only configuration 2.

Test Conditions / Notes:

EUT is a transmitter operating within 902-928 MHz. EUT is battery operated, fresh batteries installed. EUT has IO ports with cables attached. Middle port is for remote antenna and must be left open for testing integral antenna. Equipment installed according to manufacturer specifications. Equipment is configured for 10dBm output power with OOK modulation. Worst case emissions reported, including effects from hopping.
 Test procedure: ANSI C63.10 (2013)

Frequency range investigated: 614-960 MHz
 Transmitter Frequency: 903, 910, 915, 926.8 MHz.

Temperature: 27°C

SUPPLEMENTAL INFORMATION

Measurement Uncertainty

| Uncertainty Value | Parameter |
|-------------------|---------------------------|
| 4.73 dB | Radiated Emissions |
| 3.34 dB | Mains Conducted Emissions |
| 3.30 dB | Disturbance Power |

Reported uncertainties represent expanded uncertainties expressed at approximately the 95% confidence level using a coverage factor of $k=2$. Compliance is deemed to occur provided measurements are below the specified limits.

Emissions Test Details

TESTING PARAMETERS

Unless otherwise indicated, the following configuration parameters are used for equipment setup: The cables were routed consistent with the typical application by varying the configuration of the test sample. Interface cables were connected to the available ports of the test unit. The effect of varying the position of the cables was investigated to find the configuration that produced maximum emissions. Cables were of the type and length specified in the individual requirements. The length of cable that produced maximum emissions was selected.

The equipment under test (EUT) was set up in a manner that represented its normal use, as shown in the setup photographs. Any special conditions required for the EUT to operate normally are identified in the comments that accompany the emissions tables.

The emissions data was taken with a spectrum analyzer or receiver. Incorporating the applicable correction factors for distance, antenna, cable loss and amplifier gain, the data was reduced as shown in the table below. The corrected data was then compared to the applicable emission limits. Preliminary and final measurements were taken in order to ensure that all emissions from the EUT were found and maximized.

CORRECTION FACTORS

The basic spectrum analyzer reading was converted using correction factors as shown in the highest emissions readings in the tables. For radiated emissions in $\text{dB}\mu\text{V}/\text{m}$, the spectrum analyzer reading in $\text{dB}\mu\text{V}$ was corrected by using the following formula. This reading was then compared to the applicable specification limit. Individual measurements were compared with the displayed limit value in the margin column. The margin was calculated based on subtracting the limit value from the corrected measurement value; a positive margin represents a measurement exceeding the limit, while a negative margin represents a measurement less than the limit.

| SAMPLE CALCULATIONS | |
|-----------------------|-------------------------------------|
| Meter reading | ($\text{dB}\mu\text{V}$) |
| + Antenna Factor | (dB/m) |
| + Cable Loss | (dB) |
| - Distance Correction | (dB) |
| - Preamplifier Gain | (dB) |
| = Corrected Reading | ($\text{dB}\mu\text{V}/\text{m}$) |

TEST INSTRUMENTATION AND ANALYZER SETTINGS

The test instrumentation and equipment listed were used to collect the emissions data. A spectrum analyzer or receiver was used for all measurements. Unless otherwise specified, the following table shows the measuring equipment bandwidth settings that were used in designated frequency bands. For testing emissions, an appropriate reference level and a vertical scale size of 10 dB per division were used.

| MEASURING EQUIPMENT BANDWIDTH SETTINGS PER FREQUENCY RANGE | | | |
|--|---------------------|------------------|-------------------|
| TEST | BEGINNING FREQUENCY | ENDING FREQUENCY | BANDWIDTH SETTING |
| CONDUCTED EMISSIONS | 150 kHz | 30 MHz | 9 kHz |
| RADIATED EMISSIONS | 9 kHz | 150 kHz | 200 Hz |
| RADIATED EMISSIONS | 150 kHz | 30 MHz | 9 kHz |
| RADIATED EMISSIONS | 30 MHz | 1000 MHz | 120 kHz |
| RADIATED EMISSIONS | 1000 MHz | >1 GHz | 1 MHz |

SPECTRUM ANALYZER/RECEIVER DETECTOR FUNCTIONS

The notes that accompany the measurements contained in the emissions tables indicate the type of detector function used to obtain the given readings. Unless otherwise noted, all readings were made in the "positive peak" detector mode. Whenever a "quasi-peak" or "average" reading was recorded, the measurement was annotated with a "QP" or an "Ave" on the appropriate rows of the data sheets. In cases where quasi-peak or average limits were employed and data exists for multiple measurement types for the same frequency then the peak measurement was retained in the report for reference, however the numbering for the affected row was removed and an arrow or caret ("^") was placed in the far left-hand column indicating that the row above takes precedence for comparison to the limit. The following paragraphs describe in more detail the detector functions and when they were used to obtain the emissions data.

Peak

In this mode, the spectrum analyzer or receiver recorded all emissions at their peak value as the frequency band selected was scanned. By combining this function with another feature called "peak hold," the measurement device had the ability to measure intermittent or low duty cycle transient emission peak levels. In this mode the measuring device made a slow scan across the frequency band selected and measured the peak emission value found at each frequency across the band.

Quasi-Peak

Quasi-peak measurements were taken using the quasi-peak detector when the true peak values exceeded or were within 2 dB of a quasi-peak specification limit. Additional QP measurements may have been taken at the discretion of the operator.

Average

Average measurements were taken using the average detector when the true peak values exceeded or were within 2 dB of an average specification limit. Additional average measurements may have been taken at the discretion of the operator. If the specification or test procedure requires trace averaging, then the averaging was performed using 100 samples or as required by the specification. All other average measurements are performed using video bandwidth averaging. To make these measurements, the test engineer reduces the video bandwidth on the measuring device until the modulation of the signal is filtered out. At this point the measuring device is set into the linear mode and the scan time is reduced.
