

EXHIBIT D(6)

2.1047(b) Modulation Limiting

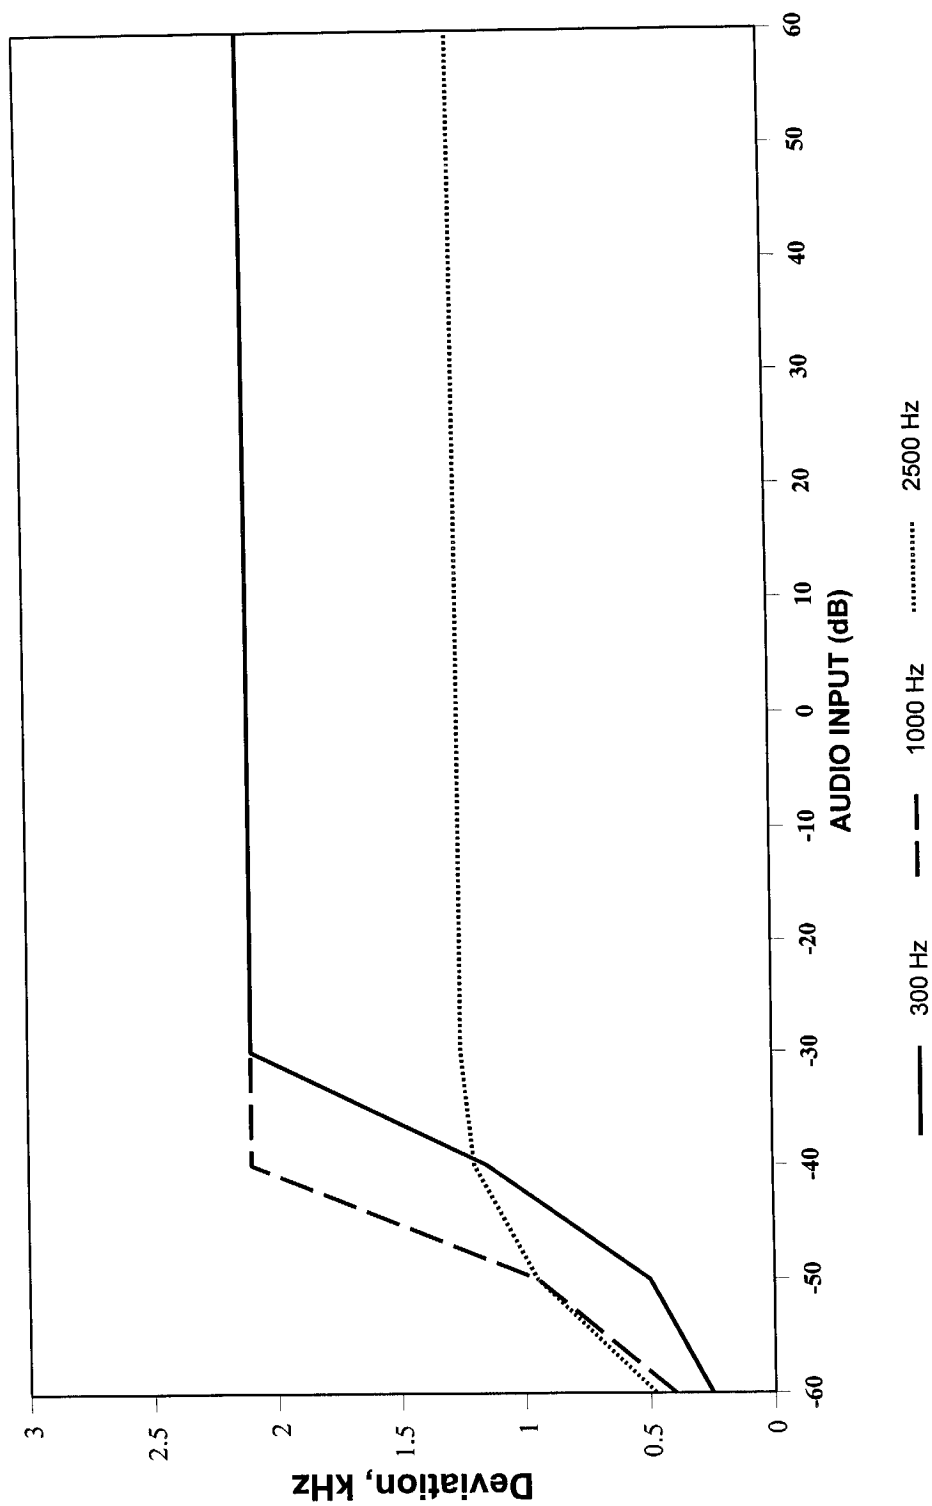

The signal generator was connected to the input of the transmitter and the modulation response was measured for each of three frequencies (one of which was the frequency of maximum response). The input voltage was varied and was observed on the Analyzer.

The input level was varied from 30% modulation to at least 20 dB higher than the saturation point.

Measurements were performed for both negative and positive modulation and the respective results were recorded.

Results - Refer Exhibit D(6)-2 and -3 attached.

# MODULATION LIMITING - Positive Peaks

# MODULATION LIMITING - Negative Peaks
