TABLE OF CONTENTS

TITLE: **INTEGRATED TEST SPECIFICATION FOR THE TR-86X VHF DATA RADIO, PART NO. 7026201**

1. SCOPE

This Integrated Test Specification establishes the manufacturing and operational requirements that the VDR, TR-**86X** must meet to ensure that the units are in proper operating condition.

This specification also contains detailed test procedures, which apply to the test equipment listed in paragraph 5.

2. REFERENCE DOCUMENTS

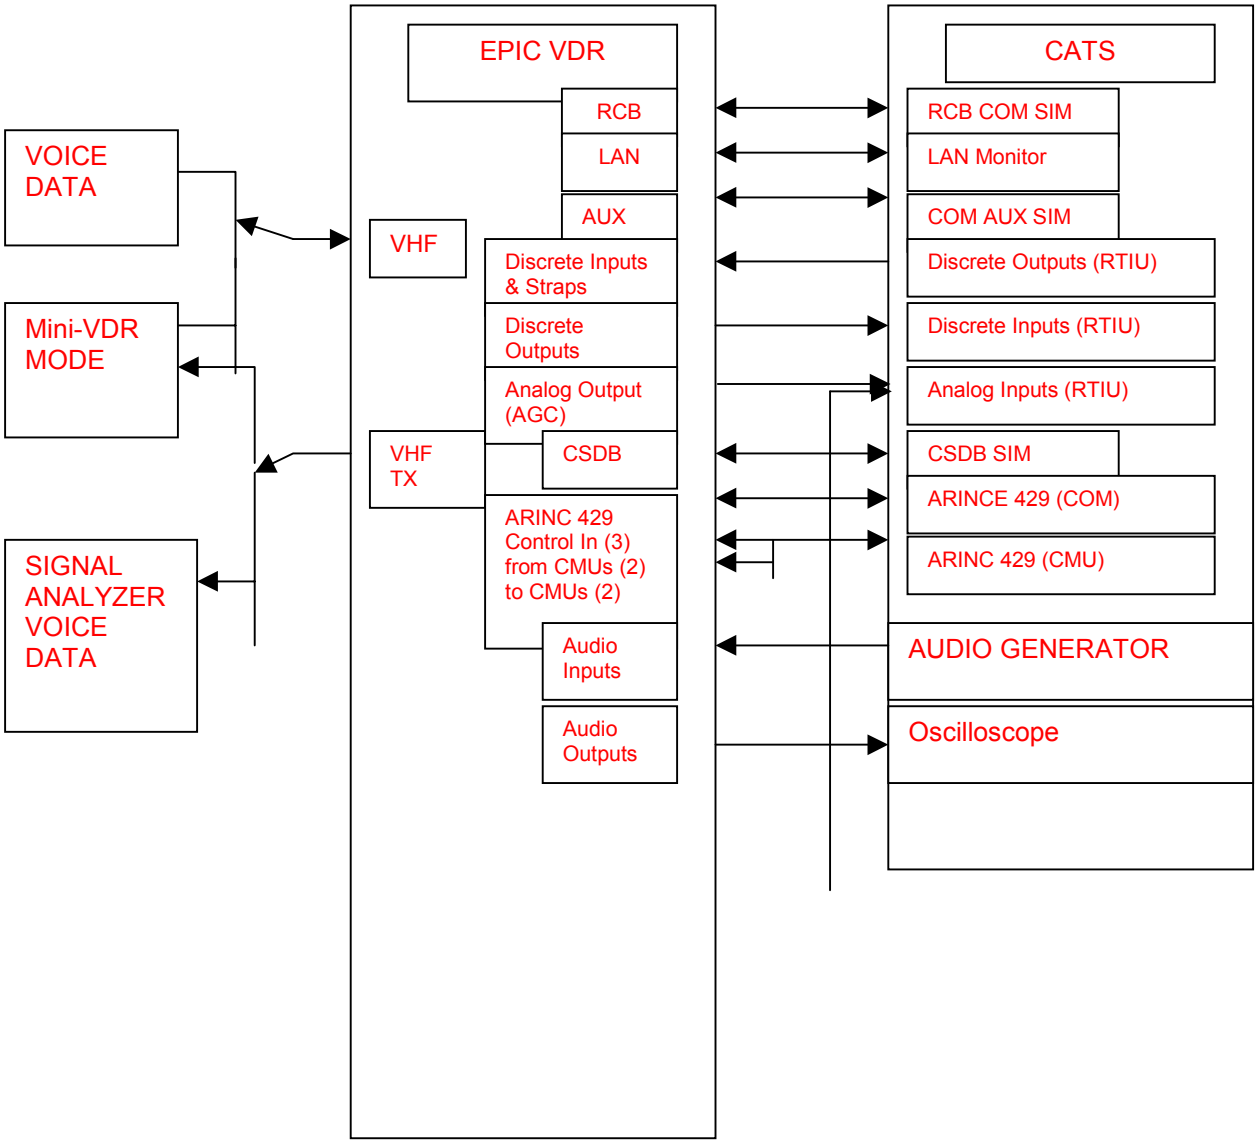
These reference documents are not required for performance of the test procedure. However, these documents provide an aid for troubleshooting should any discrepancies occur during performance of the test procedure. They are also useful for the development of test equipment and test procedures.

2.1 Assembly Prints

Final Assembly	7026201
CPU/PS	7026230-90X
I/O	7026232-90X
VHF RECEIVER	7026234-90X
VHF TRANSMITTER	7026236-90X

2.2 Block and Signal Block Diagrams

2.2.1 VDR Test Block Diagram



2.2.2 EPIC VDR Signal & Pin Assignment

The external interfaces for the EPIC VDR LRM will be pinned as specified in the following table. This connector is a 78 pin D subminiature connector that mates inside the EPIC MRC.

Table 1-2: External Interface Pin Definitions for the EPIC VDR LRM

SIGNAL NAME	SIGNAL DESCRIPTION	I/O TYPE	VDR LRM PIN #
FAN CONTROL	CONTROL FOR BOTH FANS	DISCRETE INPUT	01

2.3 Product Specification

PS7027386	System Requirements Specification for VHF Data Radio (VDR) Equipment, PN 7026201
7500301-000	Radio System Operation Specification
7500301-001	Radio Communications Bus Specification – General Specifications
7500301-002	RCB – VHF COM Data Specification

2.4 Governing Documents

EUROCAE ED-XX
Minimum Operational Performance Standards for Airborne Radio Communications Equipment Operating Within the Radio Frequency Range 118.000- 136.975 MHz.

RTCA DO-186a

Minimum Operational Performance Standards for Airborne Radio Communications Equipment Operating Within the Radio Frequency Range 118.000- 136.975 MHz

EUROCAE ED-92

Minimum Operational Performance Standards for an Airborne VDL Mode-2 Transceiver Operating in the frequency range 118-136.975 MHz.

RTCA DO-160D
Environmental Conditions and Test Procedures for Airborne Equipment

RTCA DO-178B
Software Considerations in Airborne Systems and Equipment Certification

3. GENERAL INFORMATION

3.1 All tests shall be performed under conditions of 25 ± 10 °C and less than 90 percent relative humidity, unless otherwise specified.

3.2 All input signals shall be applied between the designated terminal and ground, unless otherwise stated. All output voltages shall be measured with respect to ground, unless otherwise stated.

3.3 No warm-up period is required.

3.4 All RF input voltages are expressed in HARD micro-volts.

The term "hard" microvolts refers to the sensitivity of the receiver as measured with a signal generator calibrated in terms of open circuit E.M.F. If a signal generator calibrated in terms of output voltage across a matched load is employed, hard microvolts are observed when a 6-dB pad is connected between it and the receiver.

3.5 The signal generator output impedance shall comprise a resistance of 50 ± 5 ohms and a reactance of not more than 5 ohms.

3.6 Unless otherwise specified, all tests shall be performed with the equipment antenna jack connected to a 50-ohm load.

3.7 The Standard on channel RF signal is an RF input signal generated at the selected radio frequency.

3.8 Unless otherwise stated, the Receiver Audio Compressor shall be OFF. (RTIU - Audio Compressor - Open)

NOTE: R.T.I.U. has all loads internal. No external loads are required.

REV LTR

3.9 COMM AUDIO

3.9.1 A 600 ohm ± 10% resistive load must be applied between PHONE AUDIO HI (P5-25) and PHONE AUDIO LO (P5-5).

3.9.2 SELCAL/ACARS (P5-67) must be terminated with a 600 ohm resistive load.

3.9.3 A 150 ohm ± 10% resistive load shall be applied between MIC HI (P5-2) and MIC LO (P5-22). MIC LO (P5-22) shall be grounded. The audio signal generator shall be capacitively coupled to MIC HI (P5-2).

3.9.4 3VOICE audio input levels specified for the transmitter are those appearing at MIC HI (P5-2) when the transmitter is keyed and transmitting.

3.9.5 DATA input levels specified for the transmitter are those appearing at ACARS_DATA_IN_HI (P5-70) when the transmitter is keyed and transmitting.

3.10 The transmitter is keyed by grounding the PTT Line (P5-24). The transmitter is un-keyed by releasing the ground on the PTT Line (P5-24).

3.11 The transmitter is keyed by grounding the DATA-KEY Line (P5-15). The transmitter is un-keyed by releasing the ground on the PTT Line (P5-15).

3.12 All alphanumeric symbols bracketed by greater-than/less-than "< >" symbols will require the characters be typed and "ENTER" or "Return" typed.

3.13 Bus Errors

The test equipment may continuously monitor the RCB port of the COMM module. If such monitoring is provided, the VDR shall generate no bus errors except when the power is off or being cycled off or on.

3.14 Transmitter power measurements shall be taken at 10 seconds after the transmitter is keyed unless otherwise specified.

3.15 Each test parameter reading will have a test number assigned. Test setup instructions will occur before the reading is taken. Taking the reading is the end of that test section and subsequent instructions belong to the next test parameter

3.16 Tests are normally done in sequence and the test steps are written for this purpose. If tests are performed out of sequence the tester is responsible for insuring the correct mechanical and software setups are performed. In cases where timing is required be sure to read the entire instruction before performing the test.

A **3.17** Record test results in the Functional Test Report (Appendix C) for all manual tests.

A **3.18** When using automated test equipment refer to Appendix D.

4. POWER REQUIREMENTS

Unless otherwise specified, all tests shall be conducted with the power-input voltage adjusted to 27.5 ± 0.1 V dc. This voltage shall be measured between the power-input terminals of the U.U.T.

VDR: **P5-20,39,59 (H) and P5-18,37, 57 (L)]**

5. TEST EQUIPMENT OR EQUIVALENT

Gain Phase Meter	HP3575A or equivalent
R.F. Signal Generator	HP8656B with OPT 001 or equivalent
Modulation Analyzer	HP8901A or equivalent
Audio Analyzer	HP8903B or equivalent
Digital Voltmeter	Keithley 178 or equivalent
Spectrum Analyzer	HP141T with 8554B and 8552B or equivalent
Oscilloscope	Tektronix 2465 or equivalent
Function Generator	HP3312A or equivalent
Frequency Counter	Phillips PM6614 or equivalent
Radio Test Interface Unit (RTIU)	Honeywell 7511400-902
RTIU Software	7512001-XYY Where X = media code as specified on drawing 7512001 and YY = 17 or greater (software version)

NOTE: RTIU P/N 7511400-901 is equipped with software version 7512001-108. RTIU P/N 7511400-902 is equipped with software version 7512001-109.

Harness Assembly RTIU-TR-855	7511409-937
Trap Filter	T360055 (required only for original manufacturing tests)
ARINC 429 Test Set	JcAir 429 or equivalent

5.1 Alternate Test Equipment

Honeywell EPIC Computer Aided Test System	T336384
VDR Adapter	T336400

5.2 Test Software

The following table indicates the software part numbers and revision status for the various automated test stations and test software.

Test Station Part No.	Name	Software Part No.	Rev Letter
T336384	Epic CATS	MT7026201-500	(-)
		Or	
		MT7510763-501	(F)

A
A
A

A

6. TEST SETUP

6.1 Initial Setup

Turn the RTIU main power on.
Turn P.C. power on.
When main menu appears on screen:

Select VDR (TR-850/833/853).	<12>
Select TR-833/853	<2>

The Page Menu should appear:

Select CONFIGURATION PAGE	<C>

CONFIGURATION SOURCE DISPLAY should appear:

EXTENDED STATUS	YES	(1 VALID)
TRANSFER TONE	GND	(0 ENABLE)
AUDIO COMPRESSOR	OPEN	(1 DISABLE)
COM ACH MONITOR	GND	(0 ENABLE)
SYS POSITION	SYS 1	(00)
ARINC 716 DATA MODE	OPEN	(0 DISABLE)
TX TIMEOUT	OPEN	(0 2 MINUTES)
CHANNEL ANTIBLOCKING	OPEN	(0 DISABLE)
ARINC 429 COMPATIBLE	GND	(1 COMPATIBLE)
DATA ENABLE	OPEN	(1 ENABLE)
COM ON/OFF	OFF	
ERROR	| DATA BLOCK TIME-OUT |	

If the source display does not match the settings above, enter the appropriate letter as indicated by the menu at the bottom of the page.

Go to PAGE MENU	<P>
Select AUDIO/ANALOG PAGE	<A>
Select AUDIO SOURCE	<S>
BNC	<1>
Select AUDIO INPUT	<I>
MICROPHONE	<A>
Return to PAGE MENU	<P>
Go to RCB PAGE	<R>

Turn the 28-V dc power supply ON (Adjust supply for 27.5 V dc ± 0.1 V)

6.2 Test Setup #1

After initial setup has been performed:

Connect VDR per Figure 2.

Turn ON the 28 V dc on R.T.I.U

<F>: CHANGE FREQUENCY

<127.500> FREQUENCY IN MHz

If necessary:

<Q> Change squelch status to TEST and OPEN

<V> Voice Select

<V> VOICE mode.

SIGNAL GENERATOR:

Apply a 127.500 MHz, 3 uV RF LEVEL, with standard modulation of 1000 Hz at 30% AM to the VHF COM antenna connector.

6.3 Test Setup #2

After initial setup has been performed:

Connect VDR per Figure 3.

Turn 28 V dc on, on the RTIU.

<F>: CHANGE FREQUENCY

<127.100> FREQUENCY IN MHz

If necessary:

<Q> Change squelch status to TEST and OPEN

<V> Voice Select

<V> VOICE mode.

MODULATION ANALYZER:

Connect two 20-dB attenuators in series, between the VHF COM antenna connector and the modulation analyzer.

6.4 Test Setup # 3

After initial setup has been performed:

Connect VDR per Figure 4.

Turn ON 28 V dc power on R.T.I.U

<F>: SELECT FREQUENCY

<118.100> FREQUENCY IN MHz

If necessary:

<Q> Change squelch status to TEST and OPEN

<V> Voice Select

<V> VOICE mode.

SPECTRUM ANALYZER:

Connect two 20-dB attenuators in series, between the VHF COM antenna connector and the spectrum analyzer.

7. TEST REQUIREMENTS

Column	Description
Rev Ltr	This column is used to identify revised material.
Test No.	Tests are numbered in sequence in steps of 10. If new tests are added adding 1-9 to the end of the appropriate section will number them e.g. add new test to 1.010 results in 1.011.
Opr Limits	Unit under test (UUT) shall meet these limits whenever tested at other than the manufacturing facility. When an item is marked OPTIONAL in this column, the corresponding test is not required except as an aid in troubleshooting.
Test Description	These items are the parameters to which the unit under test was designed. In addition, these items aid in troubleshooting by specifying the input and output signal terminals. For brevity, all conditions required are not repeated for each test. Conditions established in previous tests will also apply.
Switch Pos	Perform switch settings in order specified. When an item is entered in Work Steps Column opposite a switch setting other than the first or when there is additional space between switches, perform this item before setting any other switches.
Work Steps	When work step items are entered opposite first Switch Pos, perform all switch settings first. When items are entered opposite switch setting other than first setting or when there is additional space between switches, perform work step item before setting any other switches.
Mfg Limits	Unit under test shall meet these limits prior to customer delivery.
Code	A "1" in the column indicates that the material in the next column applies only to manual test procedures. A "2" in the column indicates that the material in the next column applies only to Automatic Test Equipment procedures. A blank column indicates that the material in the next column applies equally to manual and automated test procedures.

APPENDIX A
SOFTWARE LOADING TR-86X

APPENDIX A
SOFTWARE LOADING TR-86X

4. SOFTWARE LOADING

4.17 Start the Digital Radio Flash Loader by clicking on the icon 

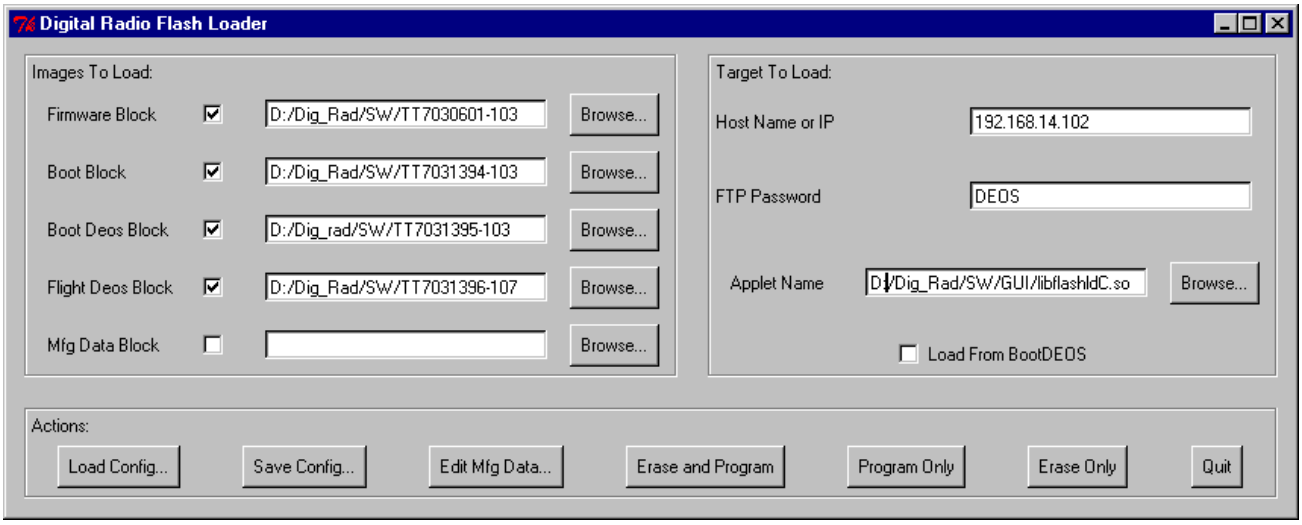
on the computer.

4.18 Select the Images that need to be loaded or changes. There must be some version of the Boot Block resident in the product in order to program the rest of the blocks. The Boot Block is initially loaded at
the card level on the CPU/Power supply.

4.19 Use the browse button to select the appropriate software blocks to load. The Software Status Table
on drawing 7026201 specifies the software part numbers to be loaded. This example indicates the
software is stored on drive D: in directory Dig_Rad/SW

4.20 Type in 192.168.14.102 as the Name, DEOS as the Password and
D:/Dig_Rad/SW/GUI/libflashldC.
so as the Applet Name.

4.21 Once every thing is selected click on the Erase and Program button. When the computer indicates the programming operation is done click the Done button.



APPENDIX B
CALIBRATION TR-86X

5. CALIBRATION SETUP

VDR Adjustment Proceedure

To set the various adjustments in the FLASH EPROM, a net debug card must be attached to J3 of 7026230-902 with switches 1 and 5 down and switches 2,3 and 4 up.

Power up the VDR with the net debug card attached and connect to the LAN port on J1 of 7026232-901 via telnet.

The following parameters must be set

RDAC1DriverBiasDat
RDAC1DriverBiasVoi
RDAC2FinalBiasDat
RDAC2FinalBiasVoi
RDAC3RFPowerDat
RDAC3RFPowerVoi
RDAC4FwdPowerDat
RDAC4FwdPowerVoi
CarrSquelHyst
CarrSquelRef
MicA2DLevel
ModIndex
NIMRxAudioLevel
NIMTxAudioLevel
NSqlHyst25K
NSqlHyst8K
NSqlRef25K
NSqlRef8K
RxAudioLevel
RxTCXOLevel
SelCalAudioLevel
SquelPwrRefLevel
TxAudioLevel
TxGain
TxOffsetD2A

6. TRANSMITTER BIAS ADJUSTMENT

To set the RDAC values, read the data that the transmitter technician has recorded on a calibration label attached to the transmitter assembly.

Set these values by typing the following commands

s rdac1driverbiasvoi xxx

s rdac2finalbiasvoi xxx

s rdac3rfpowervoi xxx

s rdac4fwdpowervoi xxx

write

Substitute the values from the calibration label for the appropriate xxx

7. CARRIER SQUELCH

7.17 **Set up per Test 5.0 .**

7.18 **Monitor the SQUELCH status on the RTIU.**

7.19 Set the Signal Generator for 15.0 uV R.F. 4000 Hz 30% modulation at the COM MODULE antenna port.

NOTE: Signal levels at the generator will vary due to cable losses. Insure that the module is receiving 15.0 uV (equivalent) R.F. input.

7.20 While monitoring the squelch status on the RTIU set the value of CarrSquelRef over the LAN by typing *s CarrSquelRef xxx.*

7.21 Set the signal Generator to less than 9 uV R.F. output and verify that the squelch status indicated CLOSED. Slowly increase the Signal Generator R.F. level until the squelch status on the RTIU indicates OPEN. The Signal Generator R.F. level shall be 15.0 ± 3 uV.

NOTE: Cable losses should always be known and compensated.

7.22 Repeat steps A1.3 through A1.5 until the trip level is 15.0 ± 3 uV

7.23 Run Test 5.0.

8. NOISE SQUELCH

8.17 Set up per Test 6.0 and 6.01.

8.17.1 Channel the radio to 127.505.

8.18 Monitor the SQUELCH status on the RTIU.

8.19 Set the Signal Generator for 2.50 uV R.F. 1000 Hz, 50% modulation at the COM MODULE antenna
port.

NOTE: Signal levels at the generator will vary due to cable losses. Insure that the module is receiving 2.50 uV (equivalent) R.F. input.

8.20 Initially set NsqlRef8k to 2000 by typing *s NsqlRef8k 2000.* While monitoring the squelch status on the RTIU adjust the value of NsqlRef8k until the squelch status is OPEN.

8.21 Set the Signal Generator to less than 1 uV R.F. output. (The DVM should show a TTl low). Slowly increase the Signal Generator R.F. level until the DVM just goes high (TTL). The Signal Generator R.F. level shall be 2. 5 $\pm$ 0.30 uV.

NOTE: Cable losses should always be known and compensated.

8.22 Repeat steps 2.3 through 2.5 until the trip level is 2.5 $\pm$ 0.3 uV.

8.23 Run Test 6.0.

9. AUDIO OUTPUT LEVEL

9.17 Set up per I.T. Test 7.0, 7.01, and 7.02. (RF power input = 1 mV, with 80% AM at 1 kHz on a carrier of 127.5 MHz)

9.18 Connect DVM to R.T.I.U. (J2S5/J2R5).

9.19 Set DVM to measure Vrms.

9.20 While monitoring the DVM adjust RXAUDIOLEVEL over the LAN by typing s RxAudioLevel xxx.
until the DVM reads 2.9 ± 0.2 Vrms.

9.21 Run test 7.0.

10. SELCAL/ACARS OUTPUT LEVEL

10.17 Set up per I.T. Test 10.0. (RF power input = 1 mV, with 70% AM at 1 kHz on a carrier of 127.5 MHz)

10.18 Connect DVM to R.T.I.U. (J2U2/J2T2).

10.19 Set DVM to measure Vrms.

10.20 While monitoring the DVM adjust SELCALAUDIOLEVEL over the LAN by typing s SelCalAudioLevel xxx until the DVM reads 0.63 ± 0.1 Vrms.

10.21 Run test 10.0.

11. CARRIER LEVEL

11.17 Set TXOFFSETD2A by typing *s TxOffsetD2A 41948*

11.18 Set TxGain by typing *TxGain 10366*.

12. MIC LEVEL

12.17 Set up per I.T. Test 22.0 and 22.01.

12.18 Turn the transmitter on and measure the (+) peak and (-) peak with the modulation analyzer. Adjust the MIC LEVEL over the LAN by typing *s MicA2Dlevel xxx* until the average of both peaks is 50 ± 5%. Write the data into FLASH.

12.19 Turn the transmitter off.

12.20 Run I.T. Test 22.0 thru 22.04.

13. DATA LEVEL

13.17 Data to be added later.

14. VOICE MODULATION LEVEL

14.17 Set up and run I.T. Test 18.0. Find the frequency with the lowest power level. Note this frequency.

14.18 Set up per Test 23.0.

14.19 Set the active radio frequency (R.T.I.U.) to the frequency determined in 14.17.

14.20 While transmitting on the frequency set in 14.17. adjust the TXGAIN over the LAN by typing *s TxGain xxx* mode so the (+) peaks and (-) peaks on the modulation analyzer average 85 ± 5%.

14.21 Transmitter off.

14.22 Run I.T. 18.0 and 23.0 all test must pass.

15. DATA MODULATION LEVEL

15.17 Procedure to be added later.

16. SIDETONE LEVEL

16.17 Set up per I.T. Test 24.0, 24.01 and 24.02

16.18 While monitoring the DVM (R.T.I.U. AUDIO SOURCE DISPLAY [AUD LEVEL]) and the COM MODULE in transmit; Adjust the Sidetone Level over the LAN by typing *s NIMTx AudioLevel xxx* until the DV reads 0.71 ± 0.03 Vrms.

16.19 Transmit off.

16.20 Run I.T. Test 24.0.

APPENDIX D
IT7026201 to IT7710763 CROSS REFERENCE

The VDR may be tested using the latest revision of MT7510763-501. This allows the 7026201 to be tested on the automatic test equipment that has been developed for the 7510763. Table D1 lists the correspondence between the IT7026201 test numbers and the MT7510763 test numbers.

In some cases there are test which are required for the 7510763 that are not required on the 7026201. In these cases, “No test required” has been entered into table D1 for the corresponding 7026201 test number.

In some cases there are tests required on the 7026201 that do not have a corresponding test on the 7510763. In these cases “No Comparable Test” has been entered into table D1 for the corresponding 7510763 test number. These tests must be performed manually using IT7026201. A manual FTR (Appendix C) shall be filled out and submitted along with the electronic FTR from the automatic test equipment.

Table D1

IT7026201 Test Number		IT7510763 Test Number
1.000 POWER ON CURRENT TEST		1.000 POWER ON CURRENT TEST
1.01		1.01
1.02		No Comparable Test
2.000 SELF TEST		2.000 SELF TEST
No test required		2.01
No test required		2.02
No test required		2.03
No test required		2.04
No test required		2.05
