REV LTR	<p>TITLE: INTEGRATED TEST SPECIFICATION FOR THE TR-86X VHF DATA RADIO, PART NO. 7026201</p> <p>1. SCOPE</p> <p>This Integrated Test Specification establishes the manufacturing and operational requirements that the VDR, TR-86X must meet to ensure that the units are in proper operating condition.</p> <p>This specification also contains detailed test procedures, which apply to the test equipment listed in paragraph 5.</p> <p>2. REFERENCE DOCUMENTS</p> <p>These reference documents are not required for performance of the test procedure. However, these documents provide an aid for troubleshooting should any discrepancies occur during performance of the test procedure. They are also useful for the development of test equipment and test procedures.</p> <p>Assembly Prints</p> <table> <tr> <td>Final Assembly</td><td>7026201</td></tr> <tr> <td>CPU/PS</td><td>7026230-90X</td></tr> <tr> <td>I/O</td><td>7026232-90X</td></tr> <tr> <td>VHF RECEIVER</td><td>7026234-90X</td></tr> <tr> <td>VHF TRANSMITTER</td><td>7026236-90X</td></tr> </table>	Final Assembly	7026201	CPU/PS	7026230-90X	I/O	7026232-90X	VHF RECEIVER	7026234-90X	VHF TRANSMITTER	7026236-90X

REV LTR	<p>3. GENERAL INFORMATION</p> <p>All tests shall be performed under conditions of 25 ± 10 °C and less than 90 percent relative humidity, unless otherwise specified.</p> <p>All input signals shall be applied between the designated terminal and ground, unless otherwise stated. All output voltages shall be measured with respect to ground, unless otherwise stated.</p> <p>No warm-up period is required.</p> <p>All RF input voltages are expressed in HARD micro-volts.</p> <p>The term "hard" microvolts refers to the sensitivity of the receiver as measured with a signal generator calibrated in terms of open circuit E.M.F. If a signal generator calibrated in terms of output voltage across a matched load is employed, hard microvolts are observed when a 6-dB pad is connected between it and the receiver.</p> <p>The signal generator output impedance shall comprise a resistance of 50 ± 5 ohms and a reactance of not more than 5 ohms.</p> <p>Unless otherwise specified, all tests shall be performed with the equipment antenna jack connected to a 50-ohm load.</p> <p>The Standard on channel RF signal is an RF input signal generated at the selected radio frequency.</p> <p>Unless otherwise stated, the Receiver Audio Compressor shall be OFF. (RTIU - Audio Compressor - Open)</p> <p>NOTE: R.T.I.U. has all loads internal. No external loads are required.</p>

REV LTR	<p>COMM AUDIO</p> <p>3.1.1 A 600 ohm \pm 10% resistive load must be applied between PHONE AUDIO HI (P5-25) and PHONE AUDIO LO (P5-5).</p> <p>3.1.2 SELCAL/ACARS (P5-67) must be terminated with a 600 ohm resistive load.</p> <p>3.1.3 A 150 ohm \pm 10% resistive load shall be applied between MIC HI (P5-2) and MIC LO (P5-22). MIC LO (P5-22) shall be grounded. The audio signal generator shall be capacitively coupled to MIC HI (P5-2).</p> <p>3.1.4 3VOICE audio input levels specified for the transmitter are those appearing at MIC HI (P5-2) when the transmitter is keyed and transmitting.</p> <p>3.1.5 DATA input levels specified for the transmitter are those appearing at ACARS_DATA_IN_HI (P5-70) when the transmitter is keyed and transmitting.</p> <p>The transmitter is keyed by grounding the PTT Line (P5-24). The transmitter is un-keyed by releasing the ground on the PTT Line (P5-24).</p> <p>The transmitter is keyed by grounding the DATA-KEY Line (P5-15). The transmitter is un-keyed by releasing the ground on the PTT Line (P5-15).</p> <p>All alphanumeric symbols bracketed by greater-than/less-than "< >" symbols will require the characters be typed and "ENTER" or "Return" typed.</p> <p>Bus Errors</p> <p>The test equipment may continuously monitor the RCB port of the COMM module. If such monitoring is provided, the VDR shall generate no bus errors except when the power is off or being cycled off or on.</p> <p>Transmitter power measurements shall be taken at 10 seconds after the transmitter is keyed unless otherwise specified.</p> <p>Each test parameter reading will have a test number assigned. Test setup instructions will occur before the reading is taken. Taking the reading is the end of that test section and subsequent instructions belong to the next test parameter</p> <p>Tests are normally done in sequence and the test steps are written for this purpose. If tests are performed out of sequence the tester is responsible for insuring the correct mechanical and software setups are performed. In cases where timing is required be sure to read the entire instruction before performing the test.</p> <p>A Record test results in the Functional Test Report (Appendix C) for all manual tests.</p> <p>G Deleted.</p>

REV LTR	7. TEST REQUIREMENTS	
	<u>Column</u>	<u>Description</u>
	Rev Ltr	This column is used to identify revised material.
	Test No.	Tests are numbered in sequence in steps of 10. If new tests are added adding 1-9 to the end of the appropriate section will number them e.g. add new test to 1.010 results in 1.011.
	Opr Limits	Unit under test (UUT) shall meet these limits whenever tested at other than the manufacturing facility. When an item is marked OPTIONAL in this column, the corresponding test is not required except as an aid in troubleshooting.
	Test Description	These items are the parameters to which the unit under test was designed. In addition, these items aid in troubleshooting by specifying the input and output signal terminals. For brevity, all conditions required are not repeated for each test. Conditions established in previous tests will also apply.
	Switch Pos	Perform switch settings in order specified. When an item is entered in Work Steps Column opposite a switch setting other than the first or when there is additional space between switches, perform this item before setting any other switches.
	Work Steps	When work step items are entered opposite first Switch Pos, perform all switch settings first. When items are entered opposite switch setting other than first setting or when there is additional space between switches, perform work step item before setting any other switches.
	Mfg Limits	Unit under test shall meet these limits prior to customer delivery.
	Code	A "1" in the column indicates that the material in the next column applies only to manual test procedures. A "2" in the column indicates that the material in the next column applies only to Automatic Test Equipment procedures. A blank column indicates that the material in the next column applies equally to manual and automated test procedures.

Test 6.0 and 6.01.</p> <p>B16.2 Channel the radio to 127.505.</p> <p>B16.3 Monitor the SQUELCH status on the RTIU.</p> <p>B16.4 Set the Signal Generator for 2.50 uV R.F. 1000 Hz, 50% modulation at the COM MODULE antenna port.</p> <p>NOTE: Signal levels at the generator will vary due to cable losses. Insure that the module is receiving 2.50 uV (equivalent) R.F. input.</p> <p>B16.5 Initially set NsqlRef8k to 2000 by typing <i>s NsqlRef8k 2000</i>. While monitoring the squelch status on the RTIU adjust the value of NsqlRef8k until the squelch status is OPEN.</p> <p>B16.6 Set the Signal Generator to less than 1 uV R.F. output. (The DVM should show a TTL low). Slowly increase the Signal Generator R.F. level until the DVM just goes high (TTL). The Signal Generator R.F. level shall be 2.5 ± 0.30 uV.</p> <p>NOTE: Cable losses should always be known and compensated.</p> <p>B16.7 Repeat steps 4.4 through 4.6 until the trip level is 2.5 ± 0.3 uV.</p> <p>B16.8 Run I.T. Test 6.0.</p>
