1 General

Introduction

Following the high standards set by the waterproof handheld VHF radios, the Axis VHF radio is designed by Navico and manufactured at our modern factory facility in UK. The radio is designed to meet or exceed stringent International Regulations including ETS300-162.

The Axis Fixed VHF range is robustly constructed using a pressure die cast aluminium for effective heat dissipation, ensuring optimum transmission performance even after many hours constant use.

Please note that VHF regulations vary from country to country. Navico sets are approved specifically by the countries in which they are sold and consequently there may be differences in the programming of sets bought in different countries. If using outside the country of purchase, it is vital to check that the set conforms to local regulations before use.

Thank you for choosing Navico

If you are pleased with your radio we hope you will be interested in our range of marine electronic equipment, which is manufactured to the same high standards as Axis. Please contact your nearest Navico Agent for a catalogue showing our increasing range of high tech navigational instruments, autopilots, radar and radio sets.

Navico operate a policy of continual development and reserve the right to alter and improve the specification of their products without notice.

Navico is a Registered Trade Mark of Navico Ltd

1.2 Axis RT1200 and RT1400

The Axis fixed VHF range consists of two models - the RT1200 and RT1400. Both are available with either a fistmike or telephone handset, and offer the same features including channel scan, channel memory, dual watch etc. The details in this owner's manual apply to both models.

The RT1400 model features an additional watchkeeping receiver, allowing it to use the Digital Selective Calling (DSC) system for routine and distress calling on VHF channel 70. For this the RT1400 will need to be linked to the Navico DSC control unit **DSC1400** (DSC Class D). DSC compatibility is not available with the RT1200 model.

This manual describes all operating features available to the RT1200 and RT1400 models, including channel scan, which is not permitted in certain countries. Therefore this feature may not be available on the set supplied if it was purchased or configured for one of these countries.

1.3 Technical Specification

Power Supply
Channel Capability (Axis200)

12v DC (10.8v - 15.5v DC)
55 international channels 1-28, 60-88 simplex & semi-duplex
UK : includes M (previously 37) and M2
USA : includes 0, 29, 89, 75, 76, Wx1-10 receive only.
Scandinavia : leisure or fishing channels as appropriate.
Canada : Canadian and USA channels.
Up to 16 private channels*

Private Channels

Transmit -

Frequency Range 155-163Mhz
Power Output 1 watt or 25 watts*
Current Consumption 5.5A (25 watts)
1.3A (1 watt)
Harmonic and Spurious Emissions < 0.25µW
Hum / Noise Modulation < -40dB
±5kHz

Receive

Audio Output Power 6 watts
Current Consumption 300mA (Full Volume, illumination on)
180mA (Fully Squelched, illumination off)
Sensitivity < 0.5µV emf for 20 dB SINAD
Harmonic and Spurious Emissions < -2nW
Hum / Noise < -40dB
Adjacent Channel Selectivity 70dB
Intermodulation Rejection 70dB

* Contact local Navico Technical Dealer for further details of channel programming etc.

RT1200 & RT1400 Waterproof Fixed VHF

4 Dimensions

1.5 Licensing

Prior to use check the national licensing requirements for the operator.

In the UK license applications and queries should be made to the following authority -

Wray Castle
Ship Radio Licensing
PO Box 5
Ambleside
LA22 0BF
Tel - 015394 34662

A set may only be operated by, or under the supervision of a holder of a **Certificate of Competence and Authority to Operate**. This involves a simple examination and an annual license renewal fee. The VHF only certificate is administered by the Royal Yachting Association -

Royal Yachting Association
RYA House
Romsey Road
Eastleigh
Hants, SO5 4YA
Tel - 01703 629962

Holders of the Restricted Certificate of Competence in Radio-telephony (which covers MF/HF SSB etc), do not need a separate VHF certificate.

In the **USA** license applications should be made to -

Federal Communications Commission
Gettysburg
PA17325
Washington DC 20554

In **Canada**, license applications should be made to -

Department of Communications
300 Slater Street
Ottawa
Ontario, K1A 0C8

In all other countries, please contact your regional authority for information.

2.2 Operation - Scanning Versions

The radio is switched on by turning the volume knob clockwise. The VHF starts up automatically on channel 16* at maximum power (25w).

2.2.1 Function (F) / Backlight (*)

NOTE - Secondary functions are only available on scanning versions of the Axis VHF.

Several of the keys have secondary functions in addition to the main function. These are accessed by pressing F, then the appropriate key within two seconds (do not hold the F key down). When F is pressed, the F legend will appear on the LCD for the two seconds it is active. Pressing another key within this time will access its second function.

Backlighting - The LCD backlighting is switched on and off as a secondary function of the F key. To turn the backlighting on/off press F twice (Fig 2.2). If the F key is kept held down the second time when switching the backlighting on, the lighting will step through five brightness levels. Release the key when the desired lighting level is reached.

2.2.2 Power (1/25) / Channel Memory (M+)

Although the radio has a maximum transmit power of 25 watts*, this is not always necessary if communicating with a station or vessel that is very close. To reduce power consumption, the transmit power can be reduced to 1 watt. This key operates as a toggle, switching between 1w and 25w (Fig 2.3).

NOTE - Some channels are restricted to 1w transmit power. The radio is programmed to switch to low power automatically when one of these channels is selected

Channel Memory function - This will add the currently selected channel into the Scan Memory. Press F then 1/25 - the LCD display will show ENT indicating that the channel has been entered into the Scan Memory. Pressing F then 1/25 if the channel is already in the memory will remove it - indicated by DEL appearing on the bottom line of the LCD display.

Fig 2.3 - Selecting transmission power (1/25W)

2.2 Operation - Scanning Versions

Location of Controls

The RT1200 and 1400 VHF's are very simple to operate, using only five buttons and three rotary knobs to access a variety of functions. The functions available will depend on whether the radio is scanning or non-scanning version (scanning functions are not permitted in certain countries).

Control	Legend	Primary function	Secondary function
1	F	Used to access secondary functions*	Switch backlighting on/off
2	1/25	Select transmit power (1w / 25w)	Enter selected channel into memory*
3	D/W	Dual Watch	Inhibit channel from scan*
4	SCN/P	Scan all channels* / Select working channel†	Scan channels in memory sequentially*
5	16	Select channel 16	
6	Sq	Squelch adjust	
7	Vol	On -off / Volume adjust	
8	Ch	Channel select knob	

* Scanning versions only. † Non scanning versions only.

Fig 2.1 - Control functions

2.2.3 Dual Watch (D/W) / Channel Inhibit (I) + Revert function

Dual Watch enables the radio to scan between the selected channel and the priority channel (normally CH16). To activate Dual Watch Mode, select the channel and press D/W. The D/W legend will be displayed on the LCD.

Note that the radio will not transmit, nor will alternative channels be able to be selected while in Dual Watch mode. To restore normal operation, either press SCN, 16 or rotate the channel select knob anticlockwise.

Inhibit Function - Since the Scan function stops on channels where a signal is detected, the radio will lock onto a channel with a lot of interference noise, or if it is transmitting a continuous carrier wave signal, preventing the radio from continuing the scan. The Inhibit function allows channels to be removed from the Scan while remaining available for use on the radio. Pressing F then D/W will inhibit the current channel - indicated by INH appearing on the bottom line of the display (Fig 2.4). Pressing F then D/W if the channel is already in inhibited will restore it to the Scan - indicated by SCN appearing on the bottom line of the display.

REVERT Function - If D/W is pressed when CH16 is selected, the Axis will revert to a previously selected channel.

2.2.4 Scan (SCN) / Memory Scan (MS)

This function scans through each channel sequentially until a signal is detected above the squelch level set. Once the signal ends or drops below the squelch level, the radio will continue scanning. Press SCN to enter scan mode. The LCD will show SCAN (Fig 2.5).

Note that the radio will not transmit, nor will alternative channels be able to be selected while in Scan mode. To restore normal operation, either press SCN, 16 or rotate the channel select knob anticlockwise. Rotating the channel selector clockwise while in Scan Mode will stop the scan on to the next channel.

The Memory Scan function (F then SCN) operates in the same way as the Scan function, except that it will only scan channels that have been entered into the Scan Memory. If no

Fig 2.4 - Inhibiting channel from Scan

Fig 2.5 - Entering Scan mode

channels have been entered into the memory then this function will not be available.

2.2.5 Channel 16 (16)

Will automatically select Channel 16 on High Power when pressed. Any function active (Dual Watch, Scanning etc) will be cancelled.

2.2.6 Squelch (Sq)

This knob is used to adjust the receiver muting threshold (squelch) level. To cut out weaker signals, increase the squelch until the background interference noise disappears. To receive weaker signals, decrease the squelch.

2.2.7 Volume, On/Off (Vol)

The radio is switched on by turning the volume knob clockwise. To increase the volume, turn the knob further clockwise. To reduce the volume, turn the knob anticlockwise. Turn the knob fully anticlockwise to switch off.

2.2.8 Channel Select (Ch)

The Axis VHF features a rotary channel selector. Rotate the knob clockwise to scroll up through the available channels, anticlockwise to scroll down (Fig 2.6)

Fig 2.6 - Changing channels

2.3 Operation - Non-scanning Versions

In countries where scanning radios are not permitted, the secondary functions listed are not available (Fig 2.7). The primary functions are the same with the following exceptions -

2.3.1 Backlight (•)

On non-scanning versions of the radio the F key is replaced with a backlighting key •. Turning the backlighting on and off requires only a single press of the • key. Press and hold the key when switching the backlight on to step through the five lighting levels and release when the desired lighting level is reached.

2.3.2 Working Channel (P)

This function allows a user selectable working channel to be programmed. Select the channel, then press and hold P. Initially the display will show the previously selected channel, but after 2 seconds the display will show the new channel and USE will appear on the bottom line of the display. This channel can now be directly accessed by pressing P.

Fig 2.7 - Controls - non-scanning versions

4 Memory Mode

This function is only available on scanning versions of the RT1200 and RT1400. It allows the radio to operate using only the channels programmed into the channel memory (see section 2.2.2).

Press **F** then **SCN**, keeping **SCN** held down for 2 seconds. Rotating the channel selector will then only select the channels programmed into the memory. To disable this mode and return to normal operation, either switch the radio off and on again, or press **16**.

This mode will only be available if there are channels programmed into the memory.

5 Second Channel Mode

In countries where it is permitted, holding **F** down while turning the radio on will enable the radio to operate on a secondary set of channels - normally the USA channels (Fig 2.8B). Where the LCD will normally show **INT** the bottom line (indicating that it is using the standard International channel set), the display will show **USA** for USA channels, **CAN** for Canadian channels etc. Channel sets available will vary depending on which country the radio is programmed for use in. Please enquire with your national licensing authority for details of permitted channel sets.

The radio will revert to normal operation if it is switched off then on again.

6 Speaker Mute

On models fitted with a telephone handset, lifting the handset from the cradle will normally mute the loudspeaker automatically.

If required, this function can be disabled by holding down **D/W** while turning the radio on. The loudspeaker will subsequently remain on when the handset is lifted.

As this setting is stored in the radio's non-volatile memory it will be remembered even if the radio is totally disconnected from the power. To restore speaker muting, hold down **D/W** again while turning the power on.

3 Installation

3.1 VHF Installation

The radio should be sited so that engine noise and vibration or other background noise do not make it difficult for the operator to hear.

Although the Axis radio is waterproof when flush mounted, it is recommended that it is not installed where it will be exposed to continuous direct sunlight, as this will eventually damage the LCD display.

As microphones and loudspeakers contain powerful magnets, the radio should not be installed within 1m (3ft 3in) of any compasses, whether magnetic or electronic.

The fins on the back of the case act as a heatsink to dissipate heat generated by the set when in use, which maintains the high efficiency of the radio. The free circulation of air is essential - if mounting the radio in an enclosed space, ensure that the space is vented.

The Axis is supplied with a reversible mounting bracket. This can be used to mount the VHF on the chart table or on an overhead bulkhead (Fig 3.1). The bracket is fixed in place using four No.10x $\frac{1}{2}$ screws (supplied). Before installing, ensure that there is at least 88mm (3.5 in) vertical clearance and 70mm (2.8in) horizontal clearance behind the bracket to allow the radio to fit (Fig 3.2).

The radio is fixed to the bracket using a simple clamp arrangement. The peg on the left side of the radio is slotted into the hole in the bracket. The clamp on the right side of the radio can then be slid into the slotted aperture on the bracket and tightened to hold the radio firmly in place (Fig 3.3). The rake angle of the radio can be adjusted by slackening the clamp.

An alternative mounting method is to use the flush mounting kit FMB1000 (supplied separately). This allows the radio to be neatly installed inside a bulkhead, so that only the fascia of the radio is visible. For more details of this and other accessories available, please refer to section 4.1.

Fig 2.8 - Selecting secondary channel set

Fig 3.1 - Standard mounting options

Fig 3.2 - Minimum clearance required

1. Fit locating peg (left side) into hole in bracket
2. Slide locking clamp (right) into slot in bracket
3. Tighten clamp

Fig 3.3 - Fixing VHF to bracket

2 Electrical Installation

The Axis radio has four electrical connections - the handset/fistmike socket is on the front panel below the LCD display (Fig 3.4A). The other three are situated on the back of the case - antenna socket is on the left (Fig 3.4B). DC power is supplied to the set via a two core flying lead (Fig 3.4C), below which is a 3.5mm jack socket for an optional extension speaker (Fig 3.4D). This socket is covered by a weather plug when not in use.

The Axis VHF requires a 12v DC supply to operate, and is supplied with a power lead which incorporates an in-line 7.5 amp fuse. This lead should be connected to the vessel's power supply, keeping the cable runs as short as possible. Although the radio draws very little current when receiving, a heavier current is drawn when transmitting which may result in a voltage drop if very long cable runs are used of inadequate core diameter. If the supplied power lead is not long enough, an extension of up to 3m (10 ft) can be made using at least 2.5mm² (13AWG) wire.

The red wire is positive and black is negative. If polarity is accidentally reversed, the set is protected but the fuse will blow. Ensure that it is replaced with a fuse of the correct 7.5 amp rating. The radio is designed to be easily removable for storage or security, so leave an adequate length of cable to ease disconnection. The flying lead from the rear of the radio can then be plugged into power supply lead. Note that the configuration of the plug prevents incorrect connection.

The antenna is connected to the radio using a standard PL259 type BNC connector as fitted to most marine antennae. If fitting to an existing antenna, check that the contacts are not corroded before connecting, as this will affect the quality of the signal. Ensure that the retaining collar of the BNC plug is securely tightened to prevent accidental disconnection.

The extension speaker socket takes a standard 3.5mm jack plug. The speaker used must have minimum impedance of 8Ω.

Fig 3.4 - External connections

3.3 Antenna Installation Recommendations

The most important factor in the performance of the Axis radio will be the quality and positioning of the antenna. Most recorded problems with VHF radios are related to poor antenna siting, faulty cabling, poor quality cable joints and low voltage supply. Even a VHF as highly advanced as Axis cannot compensate for these factors. Therefore, if replacing an existing VHF installation, it is important that these factors are checked when installing the radio.

As the range of VHF signals are governed by line of sight (see section 4.2), the antenna should be placed as high as possible, while remaining clear of any metallic objects that could influence the resonance of the antenna.

The most popular antennae for marine use are 1m (3ft 3in) long. On sail boats these are usually mounted on the masthead, where the length of the antenna keeps it clear from the navigation lights and windvanes etc. This type of antenna can also be mounted on the cockpit roof or garage of power boats.

Longer whip antennae are recommended for larger boats. These radiate the same total power as smaller antennae, but concentrate it into a narrower beam, which is advantageous on a tail mast at extreme range where concentrating the available power into a narrow horizontal beam becomes more important. However, if the antenna is not vertical when transmitting, the beam will be angled either too high or too low (Fig 3.6). Here the wider beam of the shorter antenna will be more universally effective, although the signal will be weaker (Fig 3.5). Therefore vessels with a large heel angle (small sailboats) would be better choosing a short masthead antenna. Your local agent should be able to provide specific advice on antenna choice for the vessel it is to be fitted to.

The antenna coaxial cable and any connectors used must be rated at 50Ω. Under no circumstances should standard domestic TV cable and connectors be used. Incorrectly rated cabling and connectors could result in power not reaching the antenna, but also power could be reflected back into the radio, damaging it in the process.

Fig 3.5 - Effect of heel on range of 1m marine antenna

Fig 3.6 - Effect of heel on range of longer whip antenna

The quality of any connections and integrity of the cable (i.e. no breaks in the sheathing) will directly affect the performance of the radio. Poor soldering or corrosion of the terminals can impair performance. It is recommended that screw or crimp terminal type connectors are not used for any through deck fittings - a good quality waterproof solder terminal connector will be less susceptible to poor connection due to corrosion of the contacts.

4 Electrical Interference Suppression

Interference generated by the alternator of the engine may occasionally cause problems. The radio has been designed to minimise the effects of outside interference. However, precautions should still be taken - route the power supply and antenna cables away from the engine compartment. The cable run should not be down the same trunking as other cables carrying high current. The antenna cable should also be kept separate from the radio's power cable.

Engines with spark ignition - and also some refrigerators - should be fitted with suppressors. Your local agent should be able to give advice on this, and also supply suppression kits where necessary.

4.1 Optional Accessories

The following accessories are available from your nearest Navico Technical Dealer. Please quote the correct part number when ordering.

DSC1400 DSC Controller (Class D) for use with RT1400

FMB1000 Flush Mount Kit
Suitable for RT1200, RT1400 and DSC1400

THS-4 Spare telephone handset

FTM-4 Spare listmike

Because VHF signals travel in a straight line and are not reflected back off the ionosphere as lower frequency signals are, the range of VHF signals is limited to 'line of sight', beyond which the other vessel passes behind the curve of the Earth. Therefore, the range will increase as the antenna is higher above sea level (assuming maximum transmission power is used):

Fig 4.1 VHF transmission range

Therefore, the typical ship to ship range of VHF radio such as Axis with a masthead antenna will be approximately 20 Km (12 miles). This will increase as height above sea level increases, or if the other radio user's antenna is at a greater height - note that the range between the yacht with the antenna mounted on a 9 M (30 Ft) mast and the shore increases to 46.53 Km (29.33 Miles).

Channel 0 will only be made available in the UK to Coastguard users with written authorisation. Channels M and M2 are UK marina channels and will not be programmed on non-UK radios.

Channel 70 is the designated Digital Selected Calling (DSC) channel and can only be used by an RT1400 + DSC1400.

Fault Finding

4.5 Service & Warranty

Your Axis radio should seldom need servicing, although it will benefit from an application of silicone or Teflon grease to the antenna and mic sockets each season. If it is necessary to have the unit repaired, the warranty card supplied with the unit should have been filled in and sent to Navico when the unit was purchased. Please refer to the Warranty Card booklet for more details.

The unit is guaranteed for 12 months from date of retail sale. If it is necessary to have the unit repaired, return it carriage prepaid to the agent in the country of purchase with a copy of the receipted invoice showing the date of purchase. Where possible, return all the components unless you are certain that you have located the source of the fault. If the original box is not available, ensure that it is well cushioned in packing; the rigours of freight handling can be very different from the loads encountered in the marine environment for which the unit is designed.

For Worldwide Warranty details, please refer to the Warranty Card supplied with this unit.

A list of official worldwide Navico dealers is included in the Warranty Card.

Symptom	Possible Cause	Remedy
It will not switch on	- Faulty connection to power - Fuse has blown	- Re-charge battery - Replace fuse and check power supply current
Memory Scan is not working on a channel without a signal	Noise on the channel is holding the scan	- Increase squelch level - Inhibit channel from scan (see section 2.2.3)
Watch not being entered	- Priority channel selected - Handset off cradle	- Select a working channel - Replace handset
Do not change channel	Dual Watch (D/W) engaged	Exit Dual Watch
Channel numbers not obtainable	Some channels are restricted and not programmed depending on country of purchase	Consult your national authority for permitted channels in your region
Do not transmit	Scanning or D/W function active	Exit D/W or Scan
Do not transmit on 25W OK on 1W	- Low voltage when full transmitting current is drawn - Some channels are restricted to low power transmission only	- Check power supply - Consult your national authority
Transmissions persistently cut off / display flashes 'ANT'	- Damaged antenna - Antenna cable broken - Poor contact	- Replace antenna - Replace cable - Check antenna sockets & through deck connector

These simple checks should be carried out before seeking technical assistance and may save time and expense. Before contacting your servicing agent please obtain the radio's serial number. The software iteration should also be quoted - this is shown in the large digits on the display for 2 seconds after the radio is turned on and should be written in the box below for future reference.

DIO SERIAL NO.	SOFTWARE ITERATION
