

TEST REPORT

of

FCC Part 15 Subpart B & C

Product : **802.11n 1x1 PCIe Minicard transceiver**

Model(s): **AR5B95**

Applicant: **Acer Inc.**

Address: **8F, 88, Sec. 1, Hsin Tai Wu Rd.,
Hsichih, Taipei Hsien 221
Taiwan, R. O. C.**

Test Performed by:

International Standards Laboratory

<Lung-Tan LAB>

*Site Registration No.

BSMI: SL2-IN-E-0013; TAF: 0997; IC: IC4164-1 ;

VCCI: R-1435, C-1440, T-299, R-2598, C-2845; NEMKO: ELA 113B

*Address:

No. 120, Lane 180, San Ho Tsuen, Hsin Ho Rd.

Lung-Tan Hsiang, Tao Yuan County 325, Taiwan

*Tel : 886-3-407-1718; Fax: 886-3-407-1738

Report No.: **ISL-10LR014FC**

Issue Date : **2010/05/12**

1. General

1.1 Certification of Accuracy of Test Data

Standards:	CFR 47 Part 15 Subpart B Class B CFR 47 Part 15 Subpart C (Section 15.247)
Test Procedure:	ANSI C63.4:2003
Equipment Tested:	802.11n 1x1 PCIe Minicard transceiver
Model:	AR5B95
Applied by:	Acer Inc.
Sample received Date:	2010/04/20
Final test Date :	2010/05/11
Test Result	PASS
Test Site:	Chamber 14, Conduction 02
Temperature	Refer to each site test data
Humidity:	Refer to each site test data
Test Engineer:	

Jerry Chion

All the tests in this report have been performed and recorded in accordance with the standards described above and performed by an independent electromagnetic compatibility consultant, International Standards Laboratory.

The test results contained in this report accurately represent the measurements of the characteristics and the energy generated by sample equipment under test at the time of the test. The sample equipment tested as described in this report is in compliance with the limits of above standards.

Approve & Signature

Jim Chu/ Director

Test results given in this report apply only to the specific sample(s) tested under stated test conditions. This report shall not be reproduced other than in full without the explicit written consent of ISL. This report totally contains 95 pages, including 1 cover page , 2 contents page, and 92 pages for the test description.

1.2 Test Results Summary

The 802.11b/g/n functions of EUT has been tested according to the FCC regulations listed below:

Tested Standards: 47 CFR Part 15 Subpart C			
Standard Section	Test Type	Result	Remarks
15.207	AC Power Line Emissions	Pass	
15.247(b)	Max. Peak Output Power	Pass	
15.247(c)	Radiated Emissions 30MHz – 25 GHz	Pass	
15.247 (c)	Band Edge Measurement	Pass	
15.247(b)(4)	Radiation Exposure	Pass	SAR report attached

1.3 Test Frequencies of the WLAN of EUT

Frequency of 802.11b, 802.11g and draft 802.11n Standard-20 MHz functions of EUT

EUT Channel	Test Frequency (MHz)
1	2412
6	2437
11	2462

Frequency of draft 802.11n Standard-40 MHz functions of EUT

EUT Channel	Test Frequency (MHz)
3	2422
6	2437
9	2452

1.4 Test Conditions

- a. Normal test conditions:
Temperature: 25 °C
Relative Humidity: 50% to 75%
- b. During the test, the EUT was set in continuously transmitting mode with a duty cycle of 100% (maximum allowed).
- c. The channel 1, 6, 11 of 802.11b , 802.11g and draft 802.11n Standard-20 MHz of EUT were all tested
- d. The channel 3, 6, 9 of draft 802.11n Standard-40 MHz of EUT were all tested
- e. 802.11g allows data rates 6Mbps to 54 Mbps. The EUT was tested in the data rate that produced the highest output power (6 Mbps). 802.11b allows data rates 1Mbps to 11 Mbps. The EUT was tested in the data rate that produced the highest output power (1 Mbps).
- f. draft 802.11n Standard-20 MHz allows data rates 6.5Mbps to 565Mbps. The EUT was tested in the data rate that produced the highest output power (MCS0 6.5 Mbps). draft 802.11n Standard-40 MHz allows data rates 13.5Mbps to 150 Mbps. The EUT was tested in the data rate that produced the highest output power (MCS0 13.5 Mbps).

2. Description of Equipment Under Test (EUT)

Description:	802.11n 1x1 PCIe Minicard transceiver
Condition:	Pre-Production
Model:	AR5B95
Name of Grantee:	Acer Incorporated
Frequency Range of 802.11b/g/n:	2400 - 2483.5 MHz
Support channel:	
802.11b/g	11 Channels
draft 802.11n-20MHz	11 Channels
draft 802.11n-40MHz	7 Channels
Modulation Skill:	
802.11b	DBPSK(1Mbps), DQPSK(2Mbps), CCK(5.5/11Mbps)
802.11g	OFDM (6M - 54Mbps)
Draft 802.11n	BPSK, QPSK, 16-QAM, 64-QAM
Antennas Type:	
Main antenna	PCB Antenna,made by WNC. Model: ZH9 WiFi Main Antenna
Aux antenna	PCB Antenna,made by WNC. Model: ZH9 WiFi Aux Antenna
Antenna Connected:	Connected to RF connector on the PCB of the 802.11b/g/n WLAN Adapter .The user is not possible to change the antenna without disassembling the personal computer.
Antenna peak Gain:	
Main antenna	2.39 dBi.
Aux antenna	-0.53 dBi
Power Type of wireless module:	3.3V DC from host
Output Power:	802.11b: 21.13dBm 802.11g: 25.22dBm 802.11n(HT20): 25.27dBm 802.11n(HT40): 21.94dBm

The channel and the operation frequency of 802.11b, 802.11g and draft 802.11n Standard-20 MHz is listed below:

Channel	Frequency(MHz)	Channel	Frequency(MHz)
01	2412	07	2442
02	2417	08	2447
03	2422	09	2452
04	2427	10	2457
05	2432	11	2462
06	2437		

The channels and the operation frequency of draft 802.11n Standard-40 MHz is listed below:

Channel	Frequency(MHz)	Channel	Frequency(MHz)
03	2422	07	2442
04	2427	08	2447
05	2432	09	2452
06	2437		

The EUT was installed to a Notebook Computer . There are several models and trade names for marketing demands and none of RF characteristics were changed among these models, and all models have built the transmitted antenna (WLAN Antenna) and RF module in the same positions.

Product	Notebook Computer		
Trade Name	acer, Gateway, packard bell		
Model Name	AO521, LT22, dot s, ZH9, ZH9A, ZH9B		
Housing Type	Plastic		
AC Power Adapter	DELTA	Model	ADP-40 TH AA
	LEADER	Model	IU40-11190-011S
AC Power Adapter Rating	I/P: 100-240VAC O/P: 19Vdc, 2.15A		
AC Power Cord Type	2-pin without power cord		
DC Power Cable Type	Non-shielded DC (2.5m) with one ferrite core		
CPU	AMD	Model	K125 (1.7GHz)
			K325 (1.3GHz)
			K625 (1.5GHz)
			V105 (1.2GHz)
Memory Capacity	1GB/2GB		
10.1" LED Panel	AUO	Model	B101AW06 V0 B101AW06 V1
	LPL	Model	LP101WSB-TLN1 LP101WSB-TLP2
	SAMSUNG	Model	LTN101NT05-A01
	CMO	Model	N101L6-L0D
HDD	SEAGATE	Model	ST9160314AS (160GB)
			ST9250315AS (250GB)
			ST9320325AS (320GB)
	TOSHIBA	Model	MK1665GSX (160GB)
			MK2565GSX (250GB)
			MK3265GSX (320GB)
	HGST	Model	HTS545016B9A300 (160GB)
			HTS545025B9A300 (250GB)
			HTS545032B9A300 (320GB)
	WD	Model	WD1600BEVT-22A23T0 (160GB)
			WD2500BEVT-22A23T0 (250GB)
			WD3200BEVT-22A23T0 (320GB)
Camera	Suyin	Model	SY9665SN
	Chicony	Model	CH9665SN
	Liteon	Model	LT9665AL

3G Card (Optional)	Huawei	Model	EM770W
	Ericsson	Model	F3307
	QUALCOMM	Model	Gobi2000
Bluetooth (Optional)	Broadcom (Foxconn)	Model	BCM92046 (T60H928.33)
	Broadcom (Foxconn)	Model	BCM92070 (T77H114.01)
	Atheros (Foxconn)	Model	AR3011 (T77H056.00)
Modem (Optional)	Agere	Model	A40
Battery	SIMPLO	Model	UM09E70

The I/O ports of EUT are listed below:

I/O Port Types	Quantity
DC In port	1
MIC In port	1
Headphone/SPDIF port	1
LAN port	1
USB port	3
VGA port	1
Card reader	1
HDMI port	1

The final test configuration:

AC Power Adapter	DELTA (Model: ADP-40 TH AA)
CPU	AMD Athlon (tm) II Neo K325 Dual-Core Processor 1.30GHz
LED Panel	LPL (Model: LP101WSB-TLN1)
HDD	Seagate (Model: ST9250315AS) 250GB
Battery	SIMPLO (Model: UM09E70)

3. Description of Support Equipment

3.1 Description of Support Equipment

None

3.1.1 Software for Controlling Support Unit

Test programs exercising various part of EUT were used. The programs were executed as follows:

- A. Read and write to the disk drives.
- B. The RF software makes the transmitter continuously sending RF signals
- C. Repeat the above steps.

	Filename	Issued Date
Atheros ART v0.9 b7	ART.exe	03/11/2009

4. TEST RESULTS

4.1 Powerline Conducted Emissions [Section 15.207]

4.1.1 EUT Configuration

The EUT was set up on the non-conductive table that is 1.0 by 1.5 meter, 80cm above ground. The wall of the shielded room was located 40cm to the rear of the EUT.

Power to the EUT was provided through the LISN. The impedance vs. frequency characteristic of the LISN is complied with the limit used.

Both lines (neutral and hot) were connected to the LISN in series at testing. A coaxial-type connector which provides one 50 ohms terminating impedance was provided for connecting the test instrument. The excess length of the power cord was folded back and forth at the center of the lead so as to form a bundle not exceeding 40cm in length.

Any changes made to the configuration, or modifications made to the EUT, during testing are noted in the following test record.

If the EUT is a Personal Computer or a peripheral of personal computer, and the personal computer has an auxiliary AC outlet which can be used for providing power to an external monitor, then all measurements will be made with the monitor power from first the computer-mounted AC outlet and then a floor-mounted AC outlet.

4.1.2 Test Procedure

The system was set up as described above, with the EMI diagnostic software running. The main power line conducted EMI tests were run on the hot and neutral conductors of the power cord and the results were recorded. The effect of varying the position of the interface cables has been investigated to find the configuration that produces maximum emission.

At the frequencies where the peak values of the emissions were higher than 6dB below the applicable limits, the emissions were also measured with the quasi-peak detectors. At the frequencies where the quasi-peak values of the emissions were higher than 6dB below the applicable average limits, the emissions were also measured with the average detectors.

The highest emissions were analyzed in details by operating the spectrum analyzer in fixed tuned mode to determine the nature of the emissions and to provide information which could be useful in reducing their amplitude.

4.1.3 EMI Receiver/Spectrum Analyzer Configuration (for the frequencies tested)

Frequency Range	150 KHz--30MHz
Detector Function	Quasi-Peak/Average
Bandwidth (RBW)	9KHz

4.1.4 802.11b Test Data:

802.11b Power Line Conducted Emissions (Hot) Lowest, Middle, Highest channel

No.	Frequency MHz	LISN Loss dB	Cable Loss dB	QP Correct. dBuV	QP Limit dBuV	QP Margin dB	AVG Correct. dBuV	AVG Limit dBuV	AVG Margin dB	Note

* NOTE: During the test, the EMI receiver was set to Max. Hold then switch the EUT Channel between Lowest, Middle, Highest to get the maximum reading of all these channels.
Margin = Amplitude + Insertion Loss- Limit
A margin of -8dB means that the emission is 8dB below the limit

4.2 DSSS Maximum Peak Output Power [Section 15.247 (b)(1)]

4.2.1 Test Procedure

The Transmitter output of EUT was connected to the spectrum analyzer.

The test is performed in accordance with FCC document KDB558074 "Measurement of Digital Transmission Systems Operating under Section 15.247", March 23, 2005. The transmitter operates continuously therefore Power Output Option 1 is used.

Equipment mode	Spectrum analyzer

4.3 Radiated Emission Measurement [Section [15.247(c)(4)]

4.3.1 EUT Configuration

The equipment under test was set up on the 10 meter chamber with measurement distance of 3 meters. The EUT was placed on a non-conductive table 80cm above ground.

Any changes made to the configuration, or modifications made to the EUT, during testing are noted in the following test record.

4.3.2 Test Procedure

The system was set up as described above, with the EMI diagnostic software running. We found the maximum readings by varying the height of antenna and then rotating the turntable. Both polarization of antenna, horizontal and vertical, are measured.

30M to 1GHz: The highest emissions between 30 MHz to 1000 MHz were also analyzed in details by operating the spectrum analyzer and/or EMI receiver in quasi-peak mode to determine the precise amplitude of the emissions. While doing so, the interconnecting cables and major parts of the system were moved around, the antenna height was varied between one and four meters, its polarization was varied between vertical and horizontal, and the turntable was slowly rotated, to maximize the emission.

1GHz – 25GHz: The highest emissions were also analyzed in details by operating the spectrum analyzer and/or EMI receiver in peak mode to determine the precise amplitude of the emission. While doing so, the interconnecting cables and major parts of the system were moved around, the antenna height was varied between one and four meters, its polarization was varied between vertical and horizontal, and the turntable was slowly rotated, to maximize the emission. During test the EMI receiver and spectrum was setup according to *EMI Receiver/Spectrum Analyzer Configuration*.

For the test of 2nd to 10th harmonics frequencies, the equipment setup was also refer to EMI Receiver/Spectrum Analyzer Configuration. The frequencies were tested using Peak mode first, if the test data is higher than the emissions limit, an additional measurement using Average mode will be performed and the average reading will be compared to the limit and record in test report.

4.3.3 EMI Receiver/Spectrum Analyzer Configuration (for the frequencies tested)

Frequency Range Tested:	30MHz~1000MHz
Detector Function:	Quasi-Peak Mode
Resolution Bandwidth (RBW):	120KHz
Video Bandwidth (VBW)	360KHz
Frequency Range Tested:	1GHz – 25 GHz
Detector Function:	Peak Mode
Resolution Bandwidth (RBW):	1MHz
Video Bandwidth (VBW)	3MHz
Frequency Range Tested:	1GHz – 25 GHz
Detector Function:	Average Mode
Resolution Bandwidth (RBW):	1MHz
Video Bandwidth (VBW)	10 Hz

*:Maximum data x:Over limit !:over margin

NOTE:

- During the Pre-test, the EUT has been tested for Lowest, Middle, Highest channel transmit from Main and Aux antenna respectively to get all the critical emission frequencies. In the final test all the critical emission frequencies has been tested and the test data are listed above.
- Margin = Corrected Amplitude – Limit
Corrected Amplitude = Radiated Amplitude + Antenna Correction Factor + Cable Loss - Pre-Amplifier Gain
A margin of -8dB means that the emission is 8dB below the limit

All frequencies from 30MHz to 1GHz have been tested

*:Maximum data x:Over limit !:over margin

NOTE:

- During the Pre-test, the EUT has been tested for Lowest, Middle, Highest channel transmit from Main and Aux antenna respectively to get all the critical emission frequencies. In the final test all the critical emission frequencies has been tested and the test data are listed above.

- Margin = Corrected Amplitude – Limit

Corrected Amplitude = Radiated Amplitude + Antenna Correction Factor + Cable Loss - Pre-Amplifier Gain

A margin of -8dB means that the emission is 8dB below the limit

All frequencies from 30MHz to 1GHz have been tested

1GHz~ 25 GHz (Horizontal), Lowest Channel

4.4 Band Edge Measurement

4.4.1 Test Procedure

Radiated

1. Antenna and Turntable test procedure same as Radiated Emission Measurement.
Equipment mode: Spectrum analyzer
Detector function: Peak mode
SPAN: 60MHz
RBW: 100KHz
VBW: 100KHz
Center frequency: 2.4GHz, 2.4835GHz.
2. Using Peak Search to read the peak power of Carrier frequencies after Maximum Hold function is completed
3. Find the next peak frequency outside the operation frequency band

4.5 Band Edge Restricted Bands Measurement

4.5.1 Test Procedure (Radiated)

1. Antenna and Turntable test procedure same as Radiated Emission Measurement.
Equipment mode: Spectrum analyzer
Detector function: Peak mode
SPAN: 100MHz
RBW: 1MHz
VBW: 3MHz
Center frequency: 2.39GHz, 2.4835GHz.
2. Using Peak Search to read the peak power of Carrier frequencies after Maximum Hold function is completed.
3. Find the next peak frequency outside the operation frequency band
4. For peak frequency emission level measurement in Restricted Band
Change RBW: 1MHz
VBW: 10Hz
5. Get the spectrum reading after Maximum Hold function is completed.

4.5.2 Test Setup (Radiated)

Same as *Radiated Emission Measurement*

4.6 RF Exposure Measurement [Section 15.247(b)(4) & 1.1307(b)]

Refer to SAR report

5. Appendix

5.1 Appendix A: Measurement Procedure for Power line Conducted Emissions

The measurements are performed in a 3.5m x 3.4m x 2.5m shielded room, which referred as Conduction 01 test site, or a 3m x 3m x 2.3m test site, which referred as Conduction 02 test site. The EUT was placed on non-conduction 1.0m x 1.5m table, which is 0.8 meters above an earth-grounded.

Power to the EUT was provided through the LISN which has the Impedance (50ohm/50uH) vs. Frequency Characteristic in accordance with the required standard. Power to the LISNs were filtered to eliminate ambient signal interference and these filters were bonded to the ground plane. Peripheral equipment required to provide a functional system (support equipment) for EUT testing was powered from the second LISN through a ganged, metal power outlet box which is bonded to the ground plane at the LISN.

If the EUT is supplied with a flexible power cord, the power cord length in excess of the distance separating the EUT from the LISN shall be folded back and forth at the center of the lead so as to form a bundle not exceeding 40cm in length. If the EUT is provided with a permanently coiled power cord, bundling of the cord is not required. If the EUT is supplied without a power cord, the EUT shall be connected to the LISN by a power cord of the type specified by the manufacturer which shall not be longer than 1 meter. The excess power cord shall be bundled as described above. If a non-flexible power cord is provided with the EUT, it shall be cut to the length necessary to attach the EUT to the LISN and shall not be bundled.

The interconnecting cables were arranged and moved to get the maximum emission. Both the line of power cord, hot and neutral, were measured.

The highest emissions were analyzed in details by operating the spectrum analyzer in fixed tuned mode to determine the nature of the emissions and to provide information which could be useful in reducing their amplitude.

5.2 Appendix B: Test Procedure for Radiated Emissions

Preliminary Measurements in the Anechoic Chamber

The radiated emissions are initially measured in the anechoic chamber at a measurement distance of 3 meters. Desktop EUT are placed on a wooden stand 0.8 meter in height. The measurement antenna is 3 meters from the EUT. The test setup in anechoic chamber is the same as open site. The turntable rotated 360°. The antenna height is varied from 1-2.5m. The primary objective of the radiated measurements in the anechoic chamber is to identify the frequency spectrum in the absence of the electromagnetic environment existing on the open test site. The frequencies can then be pre-selected on the open test site to obtain the corresponding amplitude. The initial scan is made with the spectrum analyzer in automatic sweep mode. The spectrum peaks are then measured manually to determine the exact frequencies.

Measurements on the Open Site or 10m EMC Chamber

The radiated emissions test will then be repeated on the open site or 10m EMC chamber to measure the amplitudes accurately and without the multiple reflections existing in the shielded room. The EUT and support equipment are set up on the turntable of one of the 3 or 10 meter open field sites. Desktop EUT are set up on a wooden stand 0.8 meter above the ground.

For the initial measurements, the receiving antenna is varied from 1-4 meter height and is changed in the vertical plane from vertical to horizontal polarization at each frequency. Both reading are recorded with the quasi-peak detector with 120KHz bandwidth. For frequency between 30 MHz and 1000MHz, the reading is recorded with peak detector or quasi-peak detector. For frequency above 1 GHz, the reading is recorded with peak detector or average detector with 1 MHz bandwidth.

At the highest amplitudes observed, the EUT is rotated in the horizontal plane while changing the antenna polarization in the vertical plane to maximize the reading. The interconnecting cables were arranged and moved to get the maximum emission. Once the maximum reading is obtained, the antenna elevation and polarization will be varied between specified limits to maximize the readings.
