. ,	If no, pls explain how was	s implemented :					
(4)	(4) Meet 15.202 requirement - ⊠ Yes , ☐ No ,						
(+)	·	☑ 163 , ☐ 1 10 ,					
	pls check below:						
	A master device is defined as a device operating in a mode in which it has the capability to transmit without receiving an enabling						
	signal. In this mode it is able to select a channel and initiate a network by sending enabling signals to other devices						
	A client device is defined as a device operating in a mode in which the transmissions of the device are under control of the						
		mode is not able to initiate					
(5)	(5) For client devices that have software configuration control to operate in different modes (active scanning in some and passive						
(3)							
	scanning in others) in different bands (devices with multiple equipment classes or those that operate on non-DFS frequencies) or						
	modular devices which configure the modes of operations through software, the application must provide software and operations						
	description on how the software and / or hardware is implemented to ensure that proper operations modes can not be modified by						
	end user or an installer.						
	🔀 Apply , 🗌 No Apply ,						
	(If apply, pls help to provide explanation on how it was implement (By hardware or software, and how software was controlled)
