## 1.4 Test Methodology

Both, conducted and radiated tests were performed according to the procedures in ANSI C63.4-1992. Radiated testing below 1 GHz was performed at an antenna to EUT distance of 10 meters above 1 GHz at an antenna to EUT distance of 3 meters. All radiated emission measurements were done in an anechoic chamber. Limits for radiated and conducted emission are in compliance with CISPR 22 resp FCC class B.

## 1.5 Test Facility

The anechoic chamber and conducted measurement facility used to collect the emission data is located at Siemens AG, Bürgermeister Ulrich Str. 100, 86199 Augsburg, Germany. This site has been fully described in a report dated January 24, 1997 submitted to your office, and accepted in a letter dated March 03, 1997 (31040/SIT).

## 3 SYSTEM TEST CONFIGURATION

### 3.1 Justification

The system was configured for testing in a maximum fashion (as a customer can use it). Each type of external ports was connected with a peripheral unit (e.g. serial port connected to a serial printer, external keyboard port connected to a keyboard and so on). During radiated emission the monitor was powered via system unit, during conducted emission also the external monitor supply was tested.

The system clock is 66,6 MHz, the clock frequency was tested with the corresponding worst case processor:

66,6 MHz clock: Intel Celeron 433 MHz

The system is provided with two kinds of power supplies:

- ASTEC, AA20650 SNI: S26113-E425-V30
- Minebea, SPW1553 SNI: S26113-E425-V20

Each power supply has been measured with each video resolution (worst case).

**Referring to radiated emission the following (worst case) results are applicable:**

**ASTEC PSU:**

Frequency range 30 MHz - 1 GHz:

66,6 MHz clock/Intel Celeron 433 MHz,

video resolution 1024 x 768/100 Hz

66,6 MHz clock/Intel Celeron 433 MHz,  
video resolution 1600 x 1200/75 Hz

Frequency range 1 GHz - 5 GHz:

66,6 MHz clock/Intel Celeron 433 MHz,  
video resolution 1600 x 1200/100 Hz

**Minebea PSU:**

Frequency range 30 MHz - 1 GHz:

66,6 MHz clock/ Intel Celeron 433 MHz,  
video resolution 1024 x 768/100 Hz

66,6 MHz clock/ Intel Celeron 433 MHz,  
video resolution 1600 x 1200/75 Hz

Frequency range 1 GHz - 5 GHz:

66,6 MHz clock/ Intel Celeron 433 MHz,  
video resolution 1600 x 1200/75 Hz

**Referring to conducted emission the following (worst case) results  
are applicable:**

**ASTEC PSU:**

66,6 MHz clock/ Intel Celeron 433 MHz,  
video resolution 1024 x 768/100 Hz, monitor power external

66,6 MHz clock/ Intel Celeron 433 MHz,  
video resolution 1600 x 1200/75 Hz, monitor power via system unit

**Minebea PSU:**

66,6 MHz clock/ Intel Celeron 433 MHz,

video resolution 1024 x 768/100 Hz, monitor power via system unit

66,6 MHz clock/ Intel Celeron 433 MHz,

video resolution 1600 x 1200/75 Hz, monitor power external

## 3.2 Video mode Justification

The system was tested in video graphic modes 1024 x 768 and 1600 x 1200. To get comparable results when measuring different video resolutions it is necessary to carry out the test with one monitor which is capable to drive all high resolutions. Such a high performance monitor has a special ferrite loaded video cable. To prove the compliance of the EUT without ferrite on the host side, we additionally tested the system with a representative standard 21" monitor provided with a cable without any ferrite in a video resolution which is usual for standard monitors (1600 x 1200). The worst case combination (with clock frequency, video mode and power supply) of the system was used to collect the included data.

The following data are applicable:

### **radiated emission:**

#### **ASTEC PSU:**

##### **Frequency range 30 MHz - 1 GHz:**

66,6 MHz clock/ Intel Celeron 433 MHz,  
video resolution 1024 x 768/100 Hz

66,6 MHz clock/ Intel Celeron 433 MHz,  
video resolution 1600 x 1200/75 Hz

##### **Frequency range 1 GHz - 5 GHz:**

66,6 MHz clock/ Intel Celeron 433 MHz,  
video resolution 1024 x 768/100 Hz

**Minebea PSU:**

Frequency range 30 MHz - 1 GHz:

66,6 MHz clock/ Intel Celeron 433 MHz,

video resolution 1600 x 1200/75 Hz

video resolution 1024 x 768/100 Hz, monitor power via system unit

66,6 MHz clock/ Intel Celeron 433 MHz,  
video resolution 1600 x 1200/75 Hz, monitor power external

## 3.3 EUT Exercise Software

The EUT exercise program used during radiated and conducted testing was designed to exercise the various system components in a manner similar to typical use.

The used sequence is:

- scrolling "H" with applicable video mode (see 3.2)
- internal Floppy drive writes to the HD and reads back
- internal CD-ROM writes to the HD
- "H`s" are sent to the printer ports
- data is sent to USB ports
- LAN / Ethernet data communication

## 3.4 Special Accessories

As shown in Figure 3.1, all interface cables used for compliance testing are shielded like normally supplied by the manufacturer. All cable connectors feature integral metal hoods for shielding.

## 3.5 Equipment Modifications

To achieve compliance to Class B levels, the following modifications were made during compliance testing:

## 5 CONDUCTED EMISSION DATA

### 5.1 Test Procedure

The initial step in collecting conducted emission data is a Rohde & Schwarz Test Receiver (ESHS10). During first scan all data in peak mode is measured, then all significant peaks are explored either in quasi-peak mode or in average mode. In case of low noise (no peak value reaches the quasi peak limit), only average checks are done.

### 5.2 Measured Data

The conducted emission was measured the following way:

1. Peak noise on L
2. Peak noise on N

During the emission measurement the printers are supplied with power via a second LISN, the monitor was either powered via the system unit or separately.

The worst case results of the corresponding configuration (video resolution, supply modus: monitor via system unit or external) is given next:

#### **ASTEC PSU**

- a) video resolution 1024 x 768/100 Hz, monitor power external
- b) video resolution 1600 x 1200/75 Hz, monitor power via system unit

# 6 RADIATED EMISSION DATA

## 6.1 Test Procedure

The radiated emission was measured in two parts:

1. in the frequency range from 30 MHz to 1000 MHz. The bandwidth of the EMI-receiver was set to 120 kHz and the detector was set to peak. During prescan all data in peak mode are accumulated automatically. At final measurement the detector was set to CISPR quasi peak and values above the acceptance line were verified automatically.
2. in the frequency range from 1000 MHz to 5000 MHz. The bandwidth of the EMI-receiver was set to 1 MHz and the detector was set to peak. During prescan all data in peak mode are accumulated automatically. At final measurement the detector was set to average and values above the acceptance line were verified automatically.

Both tests were performed in a semi anechoic chamber, measurements below 1000 MHz in a distance of 10 meters between antenna and EUT, above 1 GHz with a distance of 3 meters between antenna and EUT. During tests the EUT was turned 360° and the actual used receiving antenna was moved from 1 to 4 meters and the antenna polarisation was changed from horizontal to vertical for finding the maximum levels of emission.

For each range one antenna for the whole span was used

1. 30 MHz to 1000 MHz: log.-per antenna
2. 1000 MHz to 5000 MHz: rigid tensor antenna

After automatic tests during manual verification the cables and the equipment were placed and moved within the range of position in order to find the maximum of emission.

## 6.2 Measured Data

The EUT was measured with the Processor Intel Celeron 433 MHz in video modes 1024 x 768 and 1600 x 1200. The test results below reflect the worst case with:

## 6.5 Field Strength Calculation

The field strength is calculated by adding the Antenna Factor and Cable Factor automatically to the measured value. The display of the Receiver shows the corrected value. The complete table of correction factors is given on next page. The basic equation with a sample calculation is as follows:

$$FS = RA + AF + CF$$

where FS = Field Strength

AF = Antenna Factor (incl. Preamplifier factor)

CF = Cable Attenuation Factor

Assume a receiver reading of 28,5 dB $\mu$ V is obtained. The Antenna Factor of 10,5 and a Cable Factor of 1,3 is added, giving a field strength of 40,3 dB $\mu$ V/m.

$$FS = 28,5 + 10,5 + 1,3 = 40,3 \text{ dB}\mu\text{V/m}$$

The 40,3 dB $\mu$ V/m value can be mathematically converted to its corresponding level in  $\mu$ V/m.

Level in  $\mu$ V/m =  
Common Antilogarithm [(40,3 dB $\mu$ V/m)/20] =

**103,5  $\mu$ V/m**
