4. TEST RESULT

4.1. Peak Transmit Power and Peak Power Spectral Density Measurement

4.1.1. Limit

Peak Transmit Power:

The transmitting power of stations operating in the 4940-4990 MHz band must not exceed the maximum limits in this table.

Channel Bandwidth (MHz)	Low Power Device Peak Transmitter Power (dBm)	High Power Device Peak Transmitter Power (dBm)
1	7.0	20.0
5	14.0	27.0
10	17.0	30.0
15	18.8	31.8
20	20.0	33.0

Antenna Gain Requirement:

If the transmitting antennas of directional gain greater than 9dBi are used, both the peak transmit power and the peak power spectral density should be reduced by the amount in decibels that the directional gain of the antenna exceeds 9 dBi. However, high power point-to-point or point-to-multipoint operation (both fixed and temporary-fixed rapid deployment) may employ transmitting antennas with a directional gain up to 26 dBi without any corresponding reduction in the transmitter power or the spectral density. Corresponding reduction in the peak transmit power and peak power spectral density should be the amount in decibels that the directional gain of the antenna exceeds 26 dBi.

Peak Transmit Power Definition:

The peak transmit power is measured as a conducted emission over any interval of continuous transmission calibrated in terms of an RMS-equivalent voltage. The measurement results shall be properly adjusted for any instrument limitations, such as detector response times, limited resolution bandwidth capability when compared to the emission bandwidth, sensitivity, etc., so as to obtain a true peak measurement conforming to the definitions in this paragraph for the emission in question.

4.1.2. Measuring Instruments and Setting

Please refer to section 5 of equipments list in this report. The following table is the setting of the power meter.

Power Meter Parameter	Setting
Bandwidth	50MHz bandwidth is greater than the EUT emission bandwidth
Detector	Peak

4.1.3. Test Procedures

Use Power Meter+ Peak Sensor

4.1.4. Test Setup Layout

4.1.5. Test Deviation

There is no deviation with the original standard.

4.1.6. EUT Operation during Test

The EUT was programmed to be in continuously transmitting mode.

Note: Average output power is only for Maximum Permissible Exposure use.

4.1.7. Test Result of Peak Transmit Power

Temperature	25°C	Humidity	56%
Test Engineer	Satoshi Yang	Test Site	TH01-CB

5MHz Channel Bandwidth Mode

Frequency	Conducted Peak Power (dBm)			Total Conducted Peak Power (dBm)	Max. Limit (dBm)
	Ant. 1	Ant. 2	Ant. 3		
4945 MHz	13.34	12.42	12.30	17.48	19.23
4965 MHz	13.58	12.24	12.17	17.48	19.23
4985 MHz	13.05	12.54	12.23	17.39	19.23

NOTE: Directional gain = $29\text{dBi} + 10\log(3) = 33.77\text{dBi} > 26\text{dBi}$, so the conducted power limit = $27 - (33.77 - 26) = 19.23\text{dBm}$.

10MHz Channel Bandwidth Mode

Frequency	Conducted Peak Power (dBm)			Total Conducted Peak Power (dBm)	Max. Limit (dBm)
	Ant. 1	Ant. 2	Ant. 3		
4945 MHz	16.84	15.62	15.39	20.77	22.23
4965 MHz	16.90	15.52	15.51	20.80	22.23
4985 MHz	16.72	15.62	15.04	20.62	22.23

NOTE: Directional gain = $29\text{dBi} + 10\log(3) = 33.77\text{dBi} > 26\text{dBi}$, so the conducted power limit = $30 - (33.77 - 26) = 22.23\text{dBm}$.

4.2. Power Spectral Density Measurement

4.2.1. Limit

High power devices are also limited to a peak power spectral density of 21 dBm per 1 MHz. High power devices using channel bandwidths other than those listed above permitted; however, they are limited to a peak power spectral density of 21 dBm/MHz

4.2.2. Measuring Instruments and Setting

Please refer to section 5 in this report. The following table is the setting of the Spectrum Analyzer.

Spectrum Parameters	Setting
Detector	Peak
RBW / VBW	1MHz / 3MHz

4.2.3. Test Procedures

1. The EUT transmitter output was connected through an appropriate 50 ohm attenuator to a spectrum analyzer. Resolution bandwidth was set to 1MHz and video bandwidth was set to a value greater than the resolution bandwidth. The peak transmit power was measured as a conducted emission over the interval of continuous transmission in terms of an Peak equivalent voltage RF burst gated time with a sweep slow enough to fill the channel bandwidth.
2. Instrument limited resolution bandwidth less than channel emission bandwidth; so as to obtain a true peak measurement shall be calculated by total channel power within channel bandwidth.
3. Peak search was used to find peak power spectral density within channel bandwidth and the spectrum analyzer integrated measurement plot was taken.

4.2.4. Test Setup Layout

4.2.5. Test Deviation

There is no deviation with the original standard.

4.2.6. EUT Operation during Test

The EUT was programmed to be in continuously transmitting mode.

4.2.7. Peak Power Spectral Density (PSD)

Temperature	25°C	Humidity	56%
Test Engineer	Satoshi Yang	Test Site	TH01-CB

5MHz Channel Bandwidth Mode

Frequency	Power Density (dBm/MHz)			Total Power Density (dBm/MHz)	Max. Limit (dBm/MHz)
	Ant. 1	Ant. 2	Ant. 3		
4945 MHz	8.99	8.62	7.18	13.10	13.23
4965 MHz	9.30	8.02	7.36	13.07	13.23
4985 MHz	9.17	7.91	7.84	13.12	13.23

Note 1: Manufacturer declared that the maximum antenna gain is 21 dBi. The EUT is used for high power point-to-point or point-to-multipoint operation.

NOTE 2: Directional gain = $30\text{dBi} + 10\log(3) = 34.77\text{dBi} > 26\text{dBi}$, so the Power Spectral Density limit = $21 - (34.77 - 26) = 13.23\text{dBm}$.

10MHz Channel Bandwidth Mode

Frequency	Power Density (dBm/MHz)			Total Power Density (dBm/MHz)	Max. Limit (dBm/MHz)
	Ant. 1	Ant. 2	Ant. 3		
4945 MHz	8.62	8.03	7.34	12.80	13.23
4965 MHz	8.83	8.25	7.46	12.99	13.23
4985 MHz	9.13	7.68	7.88	13.05	13.23

Note 1: Manufacturer declared that the maximum antenna gain is 21 dBi. The EUT is used for high power point-to-point or point-to-multipoint operation.

NOTE 2: Directional gain = $30\text{dBi} + 10\log(3) = 34.77\text{dBi} > 26\text{dBi}$, so the Power Spectral Density limit = $21 - (34.77 - 26) = 13.23\text{dBm}$.

4.2.8. Antenna Gain Limit

4.3. Occupied Bandwidth and Emission Mask Measurement

4.3.1. Limit

Emission Mask M: For high power transmitters (greater than 20 dBm) operating in the 4940-4990 MHz frequency band, the power spectral density of the emissions must be attenuated below the output power of the transmitter as follows:

(1) On any frequency removed from the assigned frequency between 0–45% of the authorized bandwidth (BW): 0 dB

(2) On any frequency removed from the assigned frequency between 45–50% of the authorized bandwidth: $56.8 \log (\% \text{ of } (BW)/45)$ dB.

(3) On any frequency removed from the assigned frequency between 50–55% of the authorized bandwidth: $26 + 14.5 \log (\% \text{ of } (BW)/50)$ dB.

(4) On any frequency removed from the assigned frequency between 55–100% of the authorized bandwidth: $32 + 3.1 \log (\% \text{ of } (BW)/55)$ dB attenuation.

(5) On any frequency removed from the assigned frequency between 100–150% of the authorized bandwidth: $40 + 5.7 \log (\% \text{ of } (BW)/100)$ dB attenuation.

(6) On any frequency removed from the assigned frequency above 150% of the authorized bandwidth: 50 or $55 + 10 \log (P)$ dB, whichever is the lesser attenuation. (P in watts)

The zero dB reference is measured relative to the highest average power of the fundamental emission measured across the designated channel bandwidth using a resolution bandwidth of at least 1% of the occupied bandwidth of the fundamental emission and a video bandwidth of 30 kHz. The power spectral density is the power measured within the resolution bandwidth of the measurement device divided by the resolution bandwidth of the measurement device. Emission levels are also based on the use of measurement instrumentation employing a resolution bandwidth of at least one percent of the occupied bandwidth.

4.3.2. Measuring Instruments and Setting

Please refer to section 5 in this report. The following table is the setting of the spectrum.

Spectrum Parameter	Setting
Attenuation	Auto
Span Frequency	Encompass the entire emissions bandwidth of the signal
RB	at least 1% of the occupied bandwidth
VB	$BW = 3 \times RB$, Mask=30kHz
Detector	Peak
Trace	Max Hold

4.3.3. Test Procedures

4. The EUT transmitter was connected to a spectrum analyzer through an appropriate 50 ohm attenuator. Used measurement function of spectrum to measure the 99% occupied bandwidth.
5. The reference level for the mask was set using the highest average power of the fundamental emission measured across the channel bandwidth using a RBW of at least 1% of the occupied bandwidth of the fundamental emission and a VBW of 30 kHz.

Spectrum Parameter	Setting
Detector	Peak
Frequency Range	30MHz – 40GHz

4.6.3. Test Procedures

1. The EUT was placed on the top of the turntable in anechoic chamber.
2. A spectrum analyzer was used RBW of 1 MHz and VBW of 3 MHz for the final measurements utilizing an RMS detector at the frequencies with spurious emissions amplitudes.
3. For each suspected emissions, the antenna tower was scan (from 1 M to 4 M) and then the turntable was rotated (from 0 degree to 360 degrees) to find *spurious emissions reading*.
4. *Spurious emissions field strength level* equal to *spurious emissions reading on spectrum analyzer + Corrected Reading* (Antenna Factor + Cable Loss - Preamp Factor).
5. Final *radiated spurious emissions* may be converted from *spurious emissions field strength level* - 95.2 dB

4.7. Frequency Stability Measurement

4.7.1. Limit

The frequency stability shall be sufficient to ensure that the fundamental emissions stay within the authorized frequency band. For equipment authorization purposes, this is a reporting requirement only.

4.7.2. Measuring Instruments and Setting

Please refer to section 5 in this report. The following table is the setting of the spectrum analyzer.

Spectrum Parameter	Setting
Detector	Peak
RBW / VBW	10 kHz / 30kHz

4.7.3. Test Procedures

1. The transmitter output (antenna port) was connected to the spectrum analyzer.
2. EUT have transmitted absence of modulation signal and fixed channel.
3. Set the spectrum analyzer span to view the entire absence of modulation emissions bandwidth.
4. Set RBW = 10 kHz, VBW = 10 kHz with frequency counter function.
5. f_c is declaring of carrier channel frequency. Then the frequency error formula is $(f_c - f)/f_c \times 10^6$ ppm.
6. The test extreme voltage is to change the primary supply voltage from 85 to 115 percent of the nominal value and extreme temperature rule is $-30^\circ\text{C} \sim 50^\circ\text{C}$.

4.7.4. Test Setup Layout

4.7.5. Test Deviation

There is no deviation with the original standard.

6. SPORTON COMPANY PROFILE

SPORTON Lab. was established in 1986 with one shielded room: the first private EMI test facility, offering local manufacturers an alternative EMI test facility apart from ERSO. In 1988, one 3M and 10M/3M open area test site were setup and also obtained official accreditation from FCC, VCCI and NEMKO. In 1993, a Safety laboratory was founded and obtained accreditation from UL of USA, CSA of Canada and TUV (Rhineland & PS) of Germany. In 1995, one EMC lab, including EMI and EMS test facilities was setup. In 1997, SPORTON Group has provided financial expense to relocate the headquarter to Orient Scientific Park in Taipei Hsien to offer more comprehensive, more qualified and better service to local suppliers and manufactures. In 1999, Safety Group and Component Group were setup. In 2001, SPORTON has established 3M/10M chamber in Hwa Ya Technology Park.
