Please check below:  A master device is defined as a device operating in a mode in which it has the capability to transmit without receiving an enabling						
signal. In this mode it is able to select a channel and initiate a network by sending enabling signals to other devices						
A client device is defined as a device operating in a mode in which the transmissions of the device are under control of the master.						
		ble to initiate a network.				
(5)	For client devices that	have software configurat	ion control to operate in	different modes (active so	canning in some and passive	
scanning in others) in different bands (devices with multiple equipment classes or those that operate on non-DFS frequencies) or
