1.0 Job Description

1.1 Client Information

This EUT has been tested at the request of:

Company: LoJack Corporation
780 Dedham Street
Canton, MA 02021
Contact: Mr. Bob White
Telephone: 781-302-7128
Fax: 781-302-7299
Email: rwhite@lojack.com

1.2 Equipment Under Test

Equipment Type: Vehicle Location Unit
Model Number(s): V7E-VP
Serial number(s): 01120902900058, 01120902900046 (V7E-VP), 10 (VLU7-VP)
Manufacturer: LoJack Corporation
EUT receive date: 11-03-2008 (VLU7-VP)
06-18-2009 (V7E-VP)
EUT received condition: Prototype in Good Condition
Test start date: 11-05-2008 (VLU7-VP)
06-18-2009 (V7E-VP)
Test end date: 07-08-2009

1.3 Test Plan Reference: Tested according to the standards listed and with the guidance of ANSI/TIA-603-C-2004. Please note that the V7E-VP is a modified version of the VLU7-VP, and only the tests which would be expected to have been affected by the modifications were performed. Test data for tests which were not expected to change due to the modifications are included for reference from the VLU7-VP testing.

1.4 Test Configuration

1.4.1 Block Diagram

1.4.2. Cables:

Cable	Shielding	Connector	Length (m)	Qty.
Antenna	None	Wire	1.067	1
DC Ground	None	Wire	0.4	1
Control	None	Wire	0.4	1
DC Power	None	Wire	0.61	1

1.4.3. Support Equipment:

Name: GW DC Power Supply
 Model No.: GPS-1830D
 Serial No.: E00233

Name: Marine Battery
 Model No.: N/L
 Serial No.: N/L

1.5 Mode(s) of Operation:

The EUT was activated from a fresh battery throughout testing, except for frequency stability testing where a DC power supply was used to supply 13.8 VDC to the VLU7-VP. During frequency stability testing, samples were configured to transmit continuously in unmodulated (CW) mode. All other testing was performed using both the FSK and MSK modulation schemes, set to normal burst lengths but configured to transmit the burst repetitively to aid in testing. Conducted emissions and output power testing was performed through a Mini Circuits 50 Ohm transformer used as a temporary 50 Ohm antenna port.

1.6 Floor Standing Equipment: Applicable: _____ Not Applicable: X

2.0 Test Summary

TEST STANDARD	RESULTS	
CFR47 FCC Part 90		
SUB-TEST	TEST PARAMETER	COMMENT
RF Output Power and Spurious Emissions FCC 2.1046, 2.1053, 90.20(e)(6), 90.210(c)	RF Output Power must not exceed 2.5 Watts (34 dBm).	Pass
Conducted Spurious Emissions	Spurious emissions must not exceed –13 dBm.	Pass
Radiated Spurious Emissions	Spurious emissions must not exceed –13 dBm.	Pass
Occupied Bandwidth FCC 2.1049, 90.20(e)(6)	Occupied bandwidth must not exceed 20 kHz.	Pass
Emissions Mask FCC 90.210(c)	The transmit waveform must meet the Requirements of Emissions Mask C.	Pass
On-Time FCC 90.20(e)(6)	On time must not exceed 200 ms over the period of 1 second when the transmitter is in active mode. On time must not exceed 200 ms over the period of 10 seconds when the transmitter is not in active mode.	Pass
Transient Frequency Behavior FCC 90.214	The transmit frequency must stay within 12.5 kHz of the nominal frequency for the 20 ms after the first 5 ms that follow the transmitter being keyed on.	Pass
Frequency Stability FCC 2.1055, 90.213	Frequency drift must not exceed 50 PPM	Pass

REVISION SUMMARY – The following changes have been made to this Report:

<u>Date</u>	<u>Project No.</u>	<u>Project Handler</u>	<u>Page(s)</u>	<u>Item</u>	<u>Description of Change</u>
08/03/09	3178506	N. Abbondante	24-25	Transient plot	Updated test results for the transient frequency behavior test

3.0 Sample Calculations

The field strength is calculated by adding the Antenna Factor and Cable Factor, and subtracting the Amplifier Gain (if any) from the measured reading. The basic equation with a sample calculation is as follows:

$$FS = RA + AF + CF - AG$$

Where

- FS = Field Strength in dB μ V/m
- RA = Receiver Amplitude (including preamplifier) in dB μ V
- CF = Cable Attenuation Factor in dB
- AF = Antenna Factor in dB
- AG = Amplifier Gain in dB

In the following table(s), the reading shown on the data table reflects the preamplifier gain. An example for the calculations in the following table is as follows.

Assume a receiver reading of 52.0 dB μ V is obtained. The antenna factor of 7.4 dB and cable factor of 1.6 dB is added. The amplifier gain of 29 dB is subtracted, giving a field strength of 32 dB μ V/m. This value in dB μ V/m was converted to its corresponding level in μ V/m.

RA = 52.0 dB μ V
 AF = 7.4 dB/m
 CF = 1.6 dB
 AG = 29.0 dB
 FS = 32 dB μ V/m

$$\text{Level in } \mu\text{V/m} = [10(32 \text{ dB}\mu\text{V/m})/20] = 39.8 \mu\text{V/m}$$

The following is how net line-conducted readings were determined:

$$NF = RF + LF + CF + AF$$

Where NF = Net Reading in dB μ V

- RF = Reading from receiver in dB μ V
- LF = LISN Correction Factor in dB
- CF = Cable Correction Factor in dB
- AF = Attenuator Loss Factor in dB

To convert from dB μ V to μ V or mV the following was used:

$$UF = 10^{(NF / 20)} \text{ where UF = Net Reading in } \mu\text{V}$$

Example:

$$NF = RF + LF + CF + AF = 28.5 + 0.2 + 0.4 + 20.0 = 49.1 \text{ dB}\mu\text{V}$$

$$UF = 10^{(49.1 \text{ dB}\mu\text{V} / 20)} = 254 \mu\text{V/m}$$

3.1 Measurement Uncertainty

Compliance of the product is based on the measured value. However, the measurement uncertainty is included for informational purposes.

The expanded uncertainty ($k = 2$) for radiated emissions from 30 to 1000 MHz has been determined to be:

± 3.5 dB at 10m, ± 3.8 dB at 3m

The expanded uncertainty ($k = 2$) for mains conducted emissions from 150 kHz to 30 MHz has been determined to be:

± 2.6 dB

The expanded uncertainty ($k = 2$) for telecom port conducted emissions from 150 kHz to 30 MHz has been determined to be:

± 3.2 for ISN and voltage probe measurements

± 3.1 for current probe measurements

3.2 Site Description

Test Site(s): 2

Our OATS are 3m and 10m sheltered emissions measurement ranges located in a light commercial environment in Boxborough, Massachusetts. They meet the technical requirements of ANSI C63.4-2003 and CISPR 22:1993/EN 55022:1994 for radiated and conducted emission measurements. The shelter structure is entirely fiberglass and plastic, with outside dimensions of 33 ft x 57 ft. The structure resembles a quonset hut with a center ceiling height of 16.5 ft.

The testing floor is covered by a galvanized sheet metal groundplane that is earth-grounded via copper rods around the perimeter of the site. The joints between individual metal sheets are bridged with a 2 inch wide metal strips to provide low RF impedance contact throughout. The sheets are screwed in place with stainless steel, round-head screws every three inches. Site illumination and HVAC are provided from beneath the ground reference plane through flush entry ports, the port covers are electrically bonded to the ground plane.

A flush metal turntable with 12 ft. diameter and 5000 lb. load capacity (12,000 lb. in Site 3) is provided for floor-standing equipment. A wooden table 80 cm high is used for table-top equipment. The turntable is electrically connected to the ground plane with three copper straps. The straps are connected to the turntable at the center of it with ground braid. The copper strap is directly connected to the groundplane at the edges of the turntable. The turntable is located on the south end of the structure and the antennas are mounted 3 and 10 meters away to the north. The antenna mast is a non-conductive with remote control of antenna height and polarization. The antenna height is adjustable from 1 to 4 meters.

All final radiated emission measurements are performed with the testing personnel and measurement equipment located below the ground reference plane. The site has a full basement underneath the turntable where support equipment may be remotely located. Operation of the antenna, turntable and equipment under test is controlled by remote controls that manipulate the antenna height and polarization and with a turntable control. Test personnel are located below the ellipse when measurements are performed, however the site maintains the ability of having personnel manipulate cables while monitoring test equipment. Ambient radiated emissions are 6 dB or more below the relevant FCC emission limits.

AC mains power is brought to the equipment under test through a power line filter, to remove ambient conducted noise. 50 Hz (240 VAC single phase), 60 Hz power (120 VAC single phase, 208 VAC three phase), and 60 Hz (480 VAC three phase) are available. Conducted emission measurements are performed with a Line Impedance Stabilization Network (LISN) or Artificial Mains Network (AMN) bonded to the ground reference plane. A removable vertical groundplane (2 meter X 2 meter area) is used for line-conducted measurements for table top equipment. The vertical groundplane is electrically connected to the reference groundplane.

The EMC Lab has two Semi-anechoic Chambers and one Shielded Chamber. AC Mains Power is available at 120, 230, and 277 Single Phase; 208, 400, and 480 3-Phase. Large reference groundplanes are installed in the general lab area to facilitate EMC work not requiring a shielded environment.

Test Results: Pass

Test Standard: FCC Part 90

Test: RF Output Power

Performance Criterion: RF Output Power must not exceed 2.5 Watts (34 dBm).

Test Results: Pass

Test Standard: FCC Part 90

Test: Emissions Masks

Performance Criterion: The transmit waveform must meet the requirements of Emissions Mask C. The fundamental emission waveform must be attenuated below the measured fundamental power P in watts by zero dB for frequencies within 5 kHz of the fundamental center frequency and by $83 \cdot \log(f/5)$ dB (f in kHz) in the bands between 5 and 10 kHz offset from the fundamental center frequency. Emissions offset by 10 kHz to 50 kHz must be attenuated below the measured fundamental power by at either 50 dB or $29 \cdot \log(f^2/11)$, whichever is the lesser attenuation.

Test Results: Pass

Test Standard: FCC Part 90

Test: Transient Frequency Behavior

Performance Criterion: The EUT operates at 173.075 MHz at not more than 2.5 Watts of output power, therefore only the time interval t₂ (5-25 ms after turning the EUT on) is subject to the limits below.

equipment designed to operate on 25 kHz channels			
time intervals ¹	maximum frequency difference, kHz	frequency range, MHz	
		IC: 138-174 FCC: 150-174	IC: 406.1-470 FCC: 421-512
t ₁	± 25	5 ms	10 ms
t ₂	± 12.5	20 ms	25 ms
t ₃	± 25	5 ms	10 ms

- NOTES: 1. t_{on} is the instant when the EUT starts transmitting.
t₁ is the time period immediately following t_{on}.
t₂ is the time period immediately following t₁.
t₃ is the time period from the instant when the transmitter is turned off until t_{off}.
t_{off} is the instant when the transmitter stops transmitting.
2. If the transmitter carrier output power is 6 W or less, the frequency difference during the time periods t₁ and t₃ may exceed the maximum frequency difference limit for those periods.

Software Utilized:

Name	Manufacturer	Version
EXCEL 2003	Microsoft Corporation	11.5612.5606
EMI BOXBOROUGH	Intertek	4/17/09 Revision

Test Results:

Radiated Emissions, Substitution

Company: LoJack Corporation
 Model #: V7E-VP
 Serial #: 01120902900058 (V7E-VP)
 Engineer(s): Nicholas Abbondante
 Project #: 3178506
 Standard: FCC Part 90
 Barometer: DAV002 Temp/Humidity/Pressure: 20c/20c 61%/75% 996/999mB
 Location: Site 2
 Date(s): 6/19/2009 6/24/2009
 Rx Antenna: LOG3
 Rx Cable(s): S2 10M FLR HORN2
 Rx Preamp: NONE
 Tx Antenna: ANT1A,B,C HORN3
 Tx Cable(s): CBL030
 Tx Signal Generator: HEW62
 ERP or EIRP?: ERP
 MIN14
 REA003
 Receiver: ROS002
 Frequency Range: 30 MHz-1.8 GHz
 Net = Generator Level (0.00 dBm) + (EUT reading - Generator reading) - Cable Loss + Antenna Gain (dBi or dBd)
 Peak: PK Quasi-Peak: QP Average: AVG RMS: RMS: NF = Noise Floor RB = Restricted Band; Bandwidth denoted as RBW/VBW

Detector Type	Ant. Pol. (V/H)	Frequency MHz	EUT Reading dB(uV)	Generator Reading dB(uV)	Transmit Cable Loss dB	Transmit Antenna dBi	Generator Level dBm	Net dBm	Limit dBm	Margin dB	Bandwidth
