Supplement to EMC Test Report for Motorola portable cellular phone (FCC ID IHDP56HA2)

Prepared by:

Albert Patapack

Motorola Mobile Devices Product Safety Laboratory

Libertyville, Illinois

Summary of FCC request for additional information

There was a request for additional information regarding Motorola's SAR Test Report for Motorola portable cellular phone (FCC ID IHDP56HA2). The requested information is addressed below in the same numbering sequence received.

3. Channel in WCDMA Freq Stability of the EMC Report has a typo.
4. Please clarify which specific 3G mode was tested for the WCDMA portions of the EMC (#22044-1) and SAR (#22015-1F) tests.

Response:

3. The WCDMA 1900 Frequency Stability data on page 38 of EMC test report #22044-1 incorrectly states that channel 600 is the tested channel. This is a typo. The correct tested channel is channel 9400. The test report has been updated to reflect the correct tested channel. The updated reported is submitted along with this supplement.
4. All WCDMA EMC testing was performed in the RMC mode.
