

MOTOROLA

TESTING CERT # 2518.01

FCC ID: IHDP56KR2

DECLARATION OF COMPLIANCE SAR ASSESSMENT Part 1 of 3

Enterprise Mobility Solutions
EME Test Laboratory
 8000 West Sunrise Blvd
 Fort Lauderdale, FL. 33322.

Date of Report: 8/19/09
Report Revision: 0
Report ID: SAR rpt_H76XAH6JR7BN_Rev
 O_090819_SR7484

Responsible Engineer: Michael Sailsman (Senior Staff Eng.)
Report Author: Michael Sailsman (Senior Staff Eng.)
Date/s Tested: 7/11/09-8/7/09, 8/14/09
Manufacturer/Location: China
Sector/Group/Div.: iDEN Subscriber
Date submitted for test: 7/2/09
DUT Description: TDMA: 81:120, 2:6, 1:12, and 1:6; M64-QAM, M16-QAM, and QPSK Modulations; 0.6 W Pulse Avg; MOTotalk: 114:120 8FSK; 0.85 W nominal (GPS Capable).
Test TX mode(s): Phone: 1:3 ; Dispatch: 1:6; MOTotalk: 114:120; Data: 81:120
Max. Power output: 0.640 W pulsed average conducted power (iDEN); 0.891 W (MOTotalk)
Nominal Power: 0.60 W pulsed average conducted power (iDEN); 0.85 W (MOTotalk)
Tx Frequency Bands: 806-825, 896-902 MHz (iDEN); 902-928 MHz (MOTotalk)
Signaling type: TDMA: QPSK, M16-QAM, M64-QAM; FHSS: 8FSK (PTT)
Model(s) Tested: H76XAH6JR7AN
Model(s) Certified: H76XAH6JR7BN
Serial Number(s): 364VKKC2T3, 364VKK3N12
Classification: General Population/Uncontrolled
Rule Part(s): 15, 90

Max. Calc. : 1-g Avg. SAR: 1.03 W/kg (Body); 10-g Avg. SAR: 0.74 W/kg (Body)
Max. Calc. : 1-g Avg. SAR: 0.51 W/kg (Face); 10-g Avg. SAR: 0.36 W/kg (Face)
Max. Calc. : 1-g Avg. SAR: 0.72 W/kg (Head); 10-g Avg. SAR: 0.51 W/kg (Head)

The test results clearly demonstrate compliance with FCC General Population/Uncontrolled RF Exposure limits of 1.6W/kg averaged over 1 gram per the requirements of 47 CFR 2.1093(d).

The test results clearly demonstrate compliance with ICNIRP (1998) Guidelines for limiting exposure in time-varying electric, magnetic, and electromagnetic fields (up to 300GHz), Health Physics 74, 494-522 RF Exposure limits of 2W/kg averaged over 10grams of contiguous tissue

Based on the information and the testing results provided herein, the undersigned certifies that when used as stated in the operating instructions supplied, said product complies with the national and international reference standards and guidelines listed in section 3.0 of this report. This report shall not be reproduced without written approval from an officially designated representative of the Motorola EME Laboratory.

I attest to the accuracy of the data and assume full responsibility for the completeness of these measurements. This reporting format is consistent with the suggested guidelines of the TIA TSB-150 December 2004. The results and statements contained in this report pertain only to the device(s) evaluated.

1.0 Introduction

This report details the utilization, test setup, test equipment, and test results of the Specific Absorption Rate (SAR) measurements performed at the EMS EME Test Laboratory for model number H76XAH6JR7BN and FCC ID: IHDP56KR2. The results herein reflect prototype test results.

2.0 Abbreviations / Definitions

CNR: Calibration Not Required
DUT: Device Under Test
FSK: Frequency Shift Keying
FHSS: Frequency Hopping Spread Spectrum
iDEN: Integrated Dispatch Enhanced Network
ISM: Industrial, Scientific and Medical
M-QAM: Multi-Channel Quadrature Amplitude Modulation
NA: Not Applicable
PCS: Personal Communication System
PIFA: Planar Inverted F Antenna
PTT: Push to Talk
QPSK: Quadrature Phase-Shift Keying
SMR: Specialized Mobile Radio
SAR: Specific Absorption Rate
TDMA: Time Division Multiple Access

Audio accessories: These accessories allow communication while the DUT is worn on the body.

Body worn accessories: These accessories allow the DUT to be worn on the body of the user.

Maximum Power: Defined as the upper limit of the production line final test station.

Receive only audio accessory: Audio accessories that do not enable transmission and are for listening only.

3.0 Referenced Standards and Guidelines

This product is designed to comply with the following applicable national and international standards and guidelines.

- IEC62209-1*(2005) Procedure to determine the specific absorption rate (SAR) for hand-held devices used in close proximity to the ear (frequency range of 300 MHz to 3 GHz)
- United States Federal Communications Commission, Code of Federal Regulations; Rule Part 47CFR § 2.1093 sub-part J:1999
- Federal Communications Commission, "Evaluating Compliance with FCC Guidelines for Human Exposure to Radio frequency Electromagnetic Fields", OET Bulletin 65, Supplement C (Edition 01-01), FCC, Washington, D.C.: June 2001.
- IEEE 1528*(2003), Recommended Practice for Determining the Peak Spatial-Average Specific Absorption Rate (SAR) in the Human Head from Wireless Communications Devices: Measurement Techniques

- American National Standards Institute (ANSI) / Institute of Electrical and Electronics Engineers (IEEE) C95. 1-1992
 - Institute of Electrical and Electronics Engineers (IEEE) C95.1-2005
 - International Commission on Non-Ionizing Radiation Protection (ICNIRP) 1998
 - Ministry of Health (Canada) Safety Code 6 (1999), Limits of Human Exposure to Radio frequency Electromagnetic Fields in the Frequency Range from 3 kHz to 300 GHz
 - Australian Communications Authority Radio communications (Electromagnetic Radiation - Human Exposure) Standard (2003)
 - ANATEL, Brazil Regulatory Authority, Resolution No. 303 of July 2, 2002 "Regulation of the limitation of exposure to electrical, magnetic, and electromagnetic fields in the radio frequency range between 9kHz and 300 GHz." and "Attachment to resolution # 303 from July 2, 2002"
 - Draft of IEC62209-2 Ed.1, Human Exposure to Radio Frequency Fields from Handheld and Body-Mounted Wireless Communication Devices – Human models, Instrumentation, and Procedures Part 2: Procedure to determine the specific absorption rate (SAR) for mobile wireless communication devices used in close proximity to the human body (frequency range of 30MHz to 6GHz), revised on Oct 3, 2008.
- * The IEC62209-1 and IEEE1528 are applicable for hand-held devices used in close proximity to the ear only.

4.0 SAR Limits

TABLE 1

EXPOSURE LIMITS	SAR (W/kg)	
	(General Population / Uncontrolled Exposure Environment)	(Occupational / Controlled Exposure Environment)
Spatial Average - ANSI - (averaged over the whole body)	0.08	0.4
Spatial Peak - ANSI - (averaged over any 1-g of tissue)	1.6	8.0
Spatial Peak – ICNIRP/ANSI - (hands/wrists/feet/ankles averaged over 10-g)	4.0	20.0
Spatial Peak - ICNIRP - (Head and Trunk 10-g)	2.0	10.0

5.0 SAR Result Scaling Methodology

The calculated 1-gram and 10-gram averaged SAR results indicated as “Max Calc. 1g-SAR” and “Max Calc.10g-SAR” in the data tables is determined by scaling the measured SAR to account for power leveling variations and power slump. A table and graph of output power versus time is provided in APPENDIX G. For this device the “Max Calc. 1g-SAR” and “Max Calc.10g-SAR” are scaled using the following formula:

$$Max_Calc = SAR_meas \cdot 10^{\frac{-Drift}{10}} \cdot \frac{P_max}{P_int} \cdot DC$$

P_{max} = Maximum Power (W)
 P_{int} = Initial Power (W)
 Drift = DASY drift results (dB)
 SAR_{meas} = Measured 1-g or 10-g Avg. SAR (W/kg)
 DC = Transmission mode duty cycle in % where applicable
 50% duty cycle is applied for PTT operation
 Note: for conservative results, the following are applied:
 If $P_{int} > P_{max}$, then $P_{max}/P_{int} = 1$.
 Drift = 1 for positive drift

Additional SAR scaling was applied using the methodologies outlined in FCC KDB450824 using tissue sensitivity values. SAR was scaled for conditions where the tissue permittivity was measured above the nominal target and for tissue conductivity that was measured below the nominal target.

6.0 Description of Device Under Test (DUT)

FCC ID: IHDP56KR2 model H76XAH6JR7BN is a digital multi-service data capable device that employs time division multiplexing with duty cycles of 16.67% for Voice (Dispatch), 16.67% or 33.33% (for Interconnect or Circuit Data), and up to 67.50% for Packet Data operation. Possible modulation formats are QPSK, M16-QAM, or M64-QAM. All voice modes employ M16-QAM modulation, and are interleaved as 1:6 (for Dispatch or Interconnect) or 1:3 (maximum for Interconnect). Split 1:3 Interconnect is operated at a 16.67% duty cycle, but because there will be two pulses in each 90-msec frame, the overall interleave is 2:6. Data transmissions employ QPSK, M16-QAM, and M64-QAM modulations, and have a maximum duty cycle of 67.50% (Packet Data). Packet Data operation is possible with-and-without connection to an external data device (via a data cable or Bluetooth link). All iDEN modes (Interconnect, Dispatch, and Data) are available in both the 800 and 900 MHz SMR bands, and are also supported in the Narrowband PCS band. This device also possesses MOTotalk, which is a Part 15 service, employing Frequency Hopping Spread Spectrum technology in the 900 MHz ISM band. MOTotalk emissions have a duty cycle of 114:120, and uses 8FSK modulation. Only dispatch (i.e. PTT) operation is possible when operating in this mode. The unit may be used at the abdomen in this mode (with applicable audio accessories) or held in front of the face. The low-audio earpiece mode has been locked out in software. This device will be marketed to and used by the general population. This device may be used while held against the head in voice mode, in front of the face in PTT mode, and against the body in phone, dispatch, MOTotalk and Data modes.

FCC ID: IHDP56KR2 is capable of operating in the 806-825 MHz and 896-902MHz bands for iDEN modes and 902-928MHz band for MOTotalk mode. The nominal conducted power is 0.60 watts pulsed averaged in 806-825MHz and 896-902MHz bands and 0.850 watts in the MOTotalk band. The maximum conducted output power is 0.640 watts pulsed average and 0.891 watts respectively as defined by the upper limit of the production line final test station. FCC ID: IHDP56KR2 is being offered with the accessories listed in section 7.0.

7.0 Optional Accessories and Test Criteria

FCC ID: IHDP56KR2 is offered with optional accessories. All accessories were individually evaluated during the test plan creation to determine if testing was required. The following sections identify the test criteria and details for each accessory category.

7.1 Antennas

TABLE 2

Antenna Models	Description	Tested	* Separation distances between DUT and phantom surface for given test configurations		
			Body Test Configuration		Face Test Configuration DUT @ 2.5cm
			Tested Carry Accessories	2.5cm Assessment DUT @ 2.5cm	
Internal (HHPN1B21J5D00)	PIFA ¼ wave, 806-825MHz (1.95dBi), 896-902MHz (2.10dBi), 902-928MHz (1.90dBi)	Yes	12-15	25-25mm	25-25mm

* The 1st number indicates the minimum separation distance that was measured at the bottom of the carry holder or DUT while the second number reflects the separation distance measured at the top of the carry holder or DUT.

7.2 Batteries

All batteries were evaluated during the test plan generation.

TABLE 3

Battery Models	Description	Tested	Comments
SNN5782D	Li Ion BT60 battery	Yes	Tested with battery door NTN2440XXXXA
SNN5819B	Li Ion BT60 battery	Yes	Tested with battery door NTN2440XXXXA
SNN5826B	Li Ion BT90 battery	Yes	Tested with battery door NTN2552XXXXA

7.3 Body worn Accessories

All body worn accessories were evaluated during the test plan generation.

TABLE 4

Body worn Models	Description	Tested	* Separation distances between DUT/holder and phantom surface. (mm)	Comments
NNTN7840A	Swivel Carry Holster	Yes	12-15	Fits over front of DUT. Reference Exhibit 7B for photos of holster.

*The 1st number indicated the minimum separation distance that measured at the bottom flat surface of the holster while the second number reflects the separation distance measured at the top flat surface of the holster.

7.4 Audio/Data cable Accessories

All audio/data cable accessories were evaluated during the test plan generation.

TABLE 5

Audio Acc. Models	Description	Tested	Comments
NNTN5330B	PTT headset. Ear bud	Yes	Operates in voice mode when used at the body. The PTT operates at the body for MOTotalk only.
NNTN5211B	2-wire Surveillance headset	Yes	Operates in voice mode when used at the body. The PTT operates at the body for MOTotalk only.
NNTN6312A	3-wire Surveillance headset	Yes	Operates in voice mode when used at the body. The PTT operates at the body for MOTotalk only.
SKN6238A	Micro USB data cable	Yes	

8.0 Description of Test System

8.1 Descriptions of Robotics/Probes/Readout Electronics

The laboratory utilizes a Dosimetric Assessment System (DASY4™) SAR measurement system Version 4.7 build 80 manufactured by Schmid & Partner Engineering AG (SPEAG™), of Zurich Switzerland. The test system consists of a Stäubli RX90L robot, DAE4, and ES3DV2 E-field probe. The DASY4™ system is operated per the instructions in the DASY4™ Users Manual. The complete manual is available directly from SPEAG™. All measurement equipment used to assess EME SAR compliance was calibrated according to ISO/IEC 17025 A2LA guidelines. Section 9.0 presents additional test equipment information. Appendices B and C present the applicable calibration certificates. The E-field probe first scans a coarse grid over a large area inside the phantom in order to locate the interpolated maximum SAR distribution. After the coarse scan measurement, the probe is automatically moved to a position at the interpolated maximum. The subsequent scan can directly use this position as reference for the cube evaluations.

8.2 Description of Phantom(s)

8.2.1 Dual Flat Phantom

TABLE 6

Phantom ID	Material Parameters	Material Thickness (mm)	Support structure material	Loss Tangent (wood)
NA	200MHz -6GHz; Er = <5, Loss Tangent = 0.05	2mm +/- 0.2mm	Wood	< 0.05

8.2.2 SAM Phantom

TABLE 7

Phantom ID	Material Parameters	Material Thickness (mm)	Support structure material	Loss Tangent (wood)
SAMTP1234	200MHz -3GHz; Er = <5, Loss Tangent = 0.05	2mm +/- 0.2mm	Wood	< 0.05

8.2.3 Elliptical Flat Phantom

TABLE 8

Phantom ID (s)	Material Parameters	Phantom Dimensions LxWxD (mm)	Material Thickness (mm)	Support Structure Material	Loss Tangent (wood)
OVAL1019	300MHz -6GHz; Er = 4+/- 1, Loss Tangent = ≤0.05	600x400x190	2mm +/- 0.2mm	Wood	< 0.05

8.3 Description of Simulated Tissue

The simulated tissue used is compliant to that specified in FCC Supplement C (Edition 01-01) to OET Bulletin 65 (Edition 97-01) and IEEE Std 1528 - 2003 "Recommended Practice for Determining the Peak Spatial-Average Specific Absorption Rate (SAR) in the Human Head from Wireless Communications Devices: Measurement Techniques". The simulated tissue used is also compliant to that specified in IEC62209-1 (2005) and adopted by CENELEC as EN62209-1 (2006).

The sugar based simulate tissue is produced by placing the correct measured amount of De-ionized water into a large container. Each of the dried ingredients are weighed and added to the water carefully to avoid clumping. If the solution has a high sugar concentration the water is pre-heated to aid in dissolving the ingredients. For Diacetin and similar type simulates, sugar and HEC ingredients are not needed. The solution is mixed thoroughly, covered, and allowed to sit overnight prior to use.

Simulated Tissue Composition (by mass)

TABLE 9

% of listed ingredients	835MHz		900MHz	
	Head	Body	Head	Body
Sugar	57.0	44.9	56.5	44.9
Diacetin	0	0	0	0
De ionized -Water	40.45	53.06	40.95	53.06
Salt	1.45	0.94	1.45	0.94
HEC	1.0	1.0	1.0	1.0
Bact.	0.1	0.1	0.1	0.1

Reference section 10.1 for target parameters

9.0 Additional Test Equipment

The table below lists additional test equipment used during the SAR assessment.

10.0 SAR Measurement System Verification

The SAR measurements were conducted with probe model/serial number ES3DV2/SN3007. The system performance check was conducted daily and within 24 hours prior to testing. DASY output files of the probe/dipole calibration certificates and system performance test results are included in appendices B, C, D respectively.

Dipole validation scans using head tissue equivalent medium are provided in APPENDIX D. The EMS EME lab validated the dipole to the applicable IEEE 1528-2003 system performance targets. Within the same day system validation was performed using FCC body tissue parameters to generate the system performance target values for body at the applicable frequency. The results of the EMS EME system performance validation are provided herein.

10.1 Equivalent Tissue Test Results

Simulated tissue prepared for SAR measurements is measured daily and within 24 hours prior to actual SAR testing to verify that the tissue is within +/- 5% of target parameters at the center of the transmit band. This measurement is done using the applicable equipment indicated in section 9.0. The table below summarizes the measured tissue parameters used for the SAR assessment.

TABLE 11

10.2 System Check Test Results

System performance checks were conducted each day during the SAR assessment. The results are normalized to 1W. APPENDIX D explains how the targets were set and includes DASY plots for each day during the SAR assessment. The table below summarizes the daily system check results used for the SAR assessment.

TABLE 12

Probe Serial #	Tissue Type	Probe Cal Date	Dipole Kit / Serial #	Reference SAR @ 1W (mW/g)	System Check Test Results when normalized to 1W (mW/g)	Tested Date
3007	FCC Body	3/12/09	SPEAG D900V2 /085	11.30 +/- 10%	11.28	7/12/09
					11.48	7/31/09
					11.44	8/01/09
					11.28	8/04/09
					11.40	8/07/09
					11.16	8/14/09

					11.36	7/20/09
					11.64	8/02/09
					11.72	8/03/09

Note: See APPENDIX D for an explanation of the reference SAR targets stated above.

11.0 Environmental Test Conditions

The EME Laboratory ambient environment is well controlled resulting in very stable simulated tissue temperature and therefore stable dielectric properties. Simulated tissue temperature is measured prior to each scan to insure it is within +/- 2°C of the temperature at which the dielectric properties were determined. The liquid depth within the phantom used for measurements was at least 15cm. Additional precautions are routinely taken to ensure the stability of the simulated tissue such as covering the phantoms when scans are not actively in process in order to minimize evaporation. The lab environment is continuously monitored. The table below presents the range and average environmental conditions during the SAR tests reported herein:

TABLE 13

	Target	Measured
Ambient Temperature	18 - 25 °C	Range: 20.2-24.1 °C Avg. 21.0 °C
Relative Humidity	30 - 70 %	Range: 50.8-66.0% Avg. 57.2%
Tissue Temperature	NA	Range: 18.7-20.4 °C Avg. 19.68 °C

The EME Lab RF environment uses a Spectrum Analyzer to monitor for extraneous large signal RF contaminants that could possibly affect the test results. If such unwanted signals are discovered the SAR scans are repeated.

12.0 DUT Test Methodology

12.1 Measurements

SAR measurements were performed using the DASY system described in section 8.0 using coarse and 5x5x7 zoom scan. SAM, Dual flat and Elliptical flat phantoms filled with applicable simulated tissue were used for head, face and other body assessments respectively.

12.2 DUT Configuration(s)

The DUT is a portable device with iDEN (QPSK, M16-QAM, M64-QAM) and MOTOtalk (FHSS 8FSK) transmission signaling operational at the relevant body, head, and face locations using the applicable offered accessories. The device is placed in the test positions presented in Appendix H.

12.3 Device Positioning Procedures

The positioning of the device for each body location is described below and illustrated in APPENDIX H.

12.3.1 Body

The DUT was positioned in normal use configuration against the phantom with the offered body worn and audio accessories.

The DUT was positioned with its' front side separated 2.5cm and the back side separated 2.5cm from the phantom. Testing at 2.5cm is done to satisfy the conditions noted in the safety section of the manual.

12.3.2 Head

The DUT was placed against the right and left heads of the SAM phantom in the cheek touch and tilt positions.

12.3.3 Face

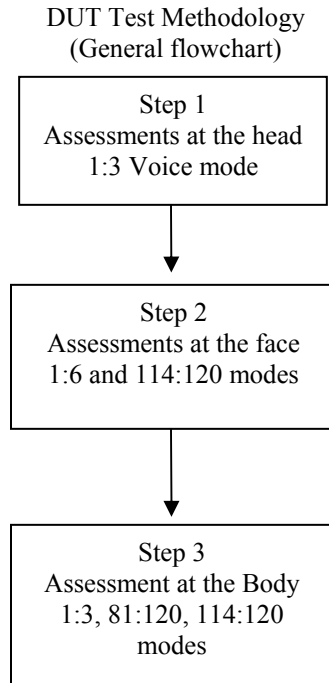

The DUT was positioned with its' front side (flip opened/closed) separated 2.5cm from the phantom.

12.4 Test Plan

All modes of operation identified in section 6.0 were considered during the development of the test plan. The mode which presented the highest duty cycle, when applicable, was chosen for SAR assessment. All accessories listed in section 7.0 of this report were evaluated.

An Expanded One Factor at A Time (OFAT) method was applied to develop the SAR test plan for this product. The following flowcharts identify the general approach to the test sequences for body and face positions.

12.4.1 General Test Flowchart

Flowchart Objectives

Step 1 – Determine the highest SAR performance at the head (Left and right ear - 1:3 mode) for the 800MHz and 900MHz bands using the offered batteries (sec. 7.2) and applicable test positions.

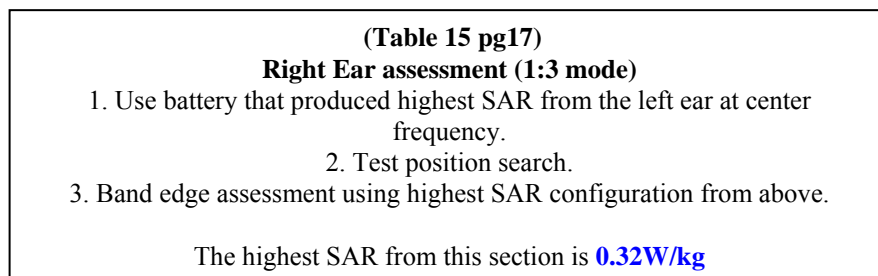

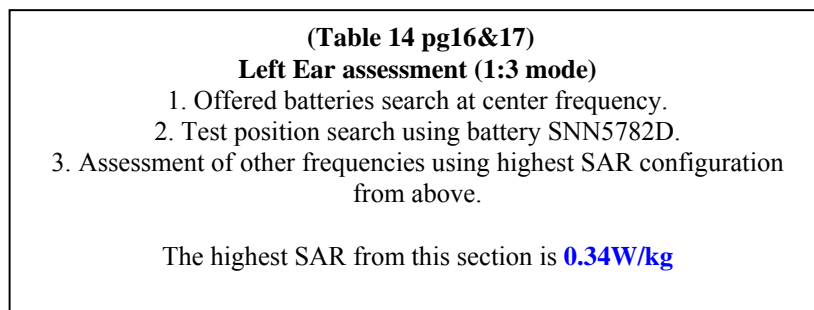

Step 2 – Determine the highest SAR performance at the face (dispatch and MOTotalk modes) for the 800MHz, 900MHz, and ISM bands using the offered batteries (sec. 7.2) and with the flip opened and closed.

Step 3 - Determine the highest SAR performance at the body (voice, data and MOTotalk modes) for the 800MHz, 900MHz, ISM bands using the offered accessories (sec. 7.0).

13.0 DUT Test Data

13.1 Head Test Flowchart Data Summary (Step 1)

806-825MHz band (1:3 mode) Assessment

896-902MHz band (1:3 mode) Assessment

(Table 16 pg17&18)
Left Ear assessment (1:3 mode)
 1. Offered batteries search at center frequency.
 2. Test position search using battery producing highest SAR.
 3. Band edge assessment using highest SAR configuration from above.

(Table 17 pg18)
Right Ear assessment (1:3 mode)
 1. Use battery that produced highest SAR from left ear at center frequency.
 2. Test position search.
 3. Band edge assessment using highest SAR configuration from above.

 The highest SAR from this section is **0.65W/kg**

Highest Results at the Head: 0.72W/kg

13.2 Head Test Data

Assessments at the Head (1:3 mode) 806-825MHz (Head Test Flowchart pg 15&16); The highest SAR result from the tables 14-15 below (Bolded) is provided in APPENDIX F Section 1.0 - Head Assessment section. *Note: The offered batteries SNN5782D and SNN5819B have similar peak SAR locations and performances. See Appendix F pages 9 and 10 for comparison. Battery SNN5782D chosen to perform subsequent tests for this band.

13.3 Face Test Flowchart Data Summary (Step 2)

806-825MHz (1:6 mode) Assessment

(Table 18 pg20)

Face assessment (1:6 dispatch)

Use battery producing highest SAR result from 800 band head tests

1. Flip position (open/close) at center frequency
2. Band edge assessment using highest SAR configuration from above

The highest SAR from this section is **0.05W/kg**

896-902MHz (1:6 mode) Assessment

(Table 19 pg20)

Face assessment (1:6 dispatch)

Use battery producing highest SAR result from 900 band head tests

1. Flip position (open/close) at center frequency
2. Band edge assessment using highest SAR configuration from above

The highest SAR from this section is **0.07W/kg**

902-928MHz MOTOTalk (114:120 mode) Assessment

(Table 20 pg21)

Face assessment (114:120 MOTOTalk)

1. Assessment of offered batteries at center frequency with flip closed
2. Assessment of other flip position
3. Assessment of other frequencies using highest SAR configuration from above

The highest SAR from this section is **0.51W/kg**

Highest Results at the Face: 0.51W/kg

13.4 Face Test Data

Assessments at the Face (1:6 mode) 806-825MHz (Face Test Flowchart pg 19); The highest SAR result from the table below (Bolded) is provided in APPENDIX F Section 2.0 - Face Assessment.

13.5 Body Test Flowchart Data Summary (Step 3)

806-825MHz (81:120) Assessment

(Table 21 pg23)

Body assessment 81:120 data mode (1:3 mode for audio/cable accessories)

1. Offered batteries search at center frequency with offered carry holster
2. Assessment of offered audio/data cables with highest SAR producing battery from above.
3. Assessment of other frequencies using highest SAR configuration from above.
4. Assessment at 2.5cm separation distance to satisfy safety manual guidelines.

The highest SAR from this section is **1.03W/kg**

896-902MHz (81:120) Assessment

(Table 22 pg24)

Body assessment 81:120 data mode (1:3 mode for audio/cable accessories)

1. Offered batteries search at center frequency with offered carry holster
2. Assessment of offered audio/data cables with highest SAR producing battery from above.
3. Assessment of other frequencies using highest SAR configuration from above.
4. Assessment at 2.5cm separation distance to satisfy safety manual guidelines.

The highest SAR from this section is **0.90W/kg**

902-928MHz (114:120) Assessment

(Table 23 pg25)

Body assessment 114:120 MOTOTalk mode

1. Offered batteries search at center frequency with offered carry Holster
2. Assessment of offered audio cables with highest SAR producing battery from above.
3. Assessment of other frequencies using highest SAR configuration from above.
4. Assessment at 2.5cm separation distance to satisfy safety manual guidelines.

The highest SAR from this section is **0.52W/kg**

Highest Results at the Body: 1.03W/kg

13.6 Body Test Data

Assessments at the Body (81:120 and 1:3 modes) 806-825MHz (Body Test Flowchart pg 22); The highest SAR result from the table below (Bolded) is provided in APPENDIX E.

TABLE 21

13.7 Shortened Scan Assessment

Short scan assessment of the overall SAR highest configuration (TABLE 21 pg23) A “shortened” scan was performed, using the test configuration and that produced the highest SAR results overall (in bold with *) below, to validate the SAR drift of the full DASY4™ coarse and 5x5x7 zoom scans. Note that the shortened scan represents the zoom scan performance result; this is obtained by first running a coarse scan to find the peak area and then, using a newly charged battery, a 5x5x7 zoom scan only was performed. The results of the shortened cube scan presented in APPENDIX E demonstrate that the scaling methodology used to determine the calculated SAR results presented herein are valid. The highest SAR result from the table below is provided in APPENDIX E Short scan assessment.

TABLE 24

Shortened Scan Assessment (iDEN 81:120 mode)												
Run Number/ SN	Antenna	Freq. (MHz)	Battery	Test position	Carry Case	Additional attachments	Initial Power (W)	SAR Drift (dB)	Meas. 1g-SAR (W/kg)	Meas. 10g-SAR (W/kg)	Max Calc. 1g-SAR (W/kg)	Max Calc. 10g-SAR (W/kg)

Shorten scan MeC-Ab-090814-02/ 364VKKC2T3	HHPN1B21J5 D00 (Internal)	824.987 5	SNN5782D w/ NTN2440XX XA	Against phantom	NNTN7840A	None	0.634	-0.012	0.972	0.649	0.98	0.70

14.0 Conclusion

The highest Operational Maximum Calculated 1-gram and 10-gram average SAR values found for FCC ID: IHDP56KR2 model H76XAH6JR7BN.

Max. Calc. : 1-g Avg. SAR: 1.03 W/kg (Body); 10-g Avg. SAR: 0.74 W/kg (Body)
Max. Calc. : 1-g Avg. SAR: 0.51 W/kg (Face); 10-g Avg. SAR: 0.36 W/kg (Face)
Max. Calc. : 1-g Avg. SAR: 0.72 W/kg (Face); 10-g Avg. SAR: 0.51 W/kg (Head)

The test results clearly demonstrate compliance with FCC General Population/Uncontrolled RF Exposure limits of **1.6 W/kg** per the requirements of 47 CFR 2.1093(d).

APPENDIX A

Measurement Uncertainty

The Measurement Uncertainty tables indicated in this APPENDIX are applicable to the DUT ranging from 800MHz to 3GHz, and for Dipole test frequency ranging from 800MHz to 3GHz. Therefore, the highest tolerance for the probe calibration uncertainty is indicated.

Table 1A: Uncertainty Budget for Device Under Test, for 800MHz to 3GHz

Notes for Tables 1, 2, 3 and 4

- a) Column headings *a-k* are given for reference.
- b) Tol. - tolerance in influence quantity.
- c) Prob. Dist. – Probability distribution
- d) N, R - normal, rectangular probability distributions
- e) Div. - divisor used to translate tolerance into normally distributed standard uncertainty
- f) c_i - sensitivity coefficient that should be applied to convert the variability of the uncertainty component into a variability of SAR.
- g) u_i – SAR uncertainty
- h) v_i - degrees of freedom for standard uncertainty and effective degrees of freedom for the expanded uncertainty

APPENDIX B
Probe Calibration Certificates

Calibration Laboratory of
 Schmid & Partner
 Engineering AG
 Zeughausstrasse 43, 8004 Zurich, Switzerland

S Schweizerischer Kalibrierdienst
S Service suisse d'étalonnage
C Servizio svizzero di taratura
S Swiss Calibration Service

Accredited by the Swiss Accreditation Service (SAS)
 The Swiss Accreditation Service is one of the signatories to the EA
 Multilateral Agreement for the recognition of calibration certificates

Accreditation No.: **SCS 108**

Client **Motorola Plantation EME Lab**

Certificate No: **ES3-3007_Mar09**

CALIBRATION CERTIFICATE

Object **ES3DV2 - SN:3007**

Calibration procedure(s) **QA CAL-01.v6, QA CAL-12.v5, QA CAL-14.v3 and QA CAL-23.v3
 Calibration procedure for dosimetric E-field probes**

Calibration date: **March 12, 2009**

Condition of the calibrated item **In Tolerance**

This calibration certificate documents the traceability to national standards, which realize the physical units of measurements (SI).
 The measurements and the uncertainties with confidence probability are given on the following pages and are part of the certificate.

All calibrations have been conducted in the closed laboratory facility: environment temperature (22 ± 3)°C and humidity < 70%.

Calibration Equipment used (M&TE critical for calibration)

Primary Standards	ID #	Cal Date (Certificate No.)	Scheduled Calibration

Accredited by the Swiss Accreditation Service (SAS)
The Swiss Accreditation Service is one of the signatories to the EA
Multilateral Agreement for the recognition of calibration certificates

Accreditation No.: **SCS 108**

Glossary:

TSL	tissue simulating liquid
NORM _{x,y,z}	sensitivity in free space
ConvF	sensitivity in TSL / NORM _{x,y,z}
DCP	diode compression point
Polarization φ	φ rotation around probe axis
Polarization ϑ	ϑ rotation around an axis that is in the plane normal to probe axis (at measurement center), i.e., $\vartheta = 0$ is normal to probe axis

Calibration is Performed According to the Following Standards:

- IEEE Std 1528-2003, "IEEE Recommended Practice for Determining the Peak Spatial-Averaged Specific Absorption Rate (SAR) in the Human Head from Wireless Communications Devices: Measurement Techniques", December 2003
- IEC 62209-1, "Procedure to measure the Specific Absorption Rate (SAR) for hand-held devices used in close proximity to the ear (frequency range of 300 MHz to 3 GHz)", February 2005

Methods Applied and Interpretation of Parameters:

- NORM_{x,y,z}**: Assessed for E-field polarization $\vartheta = 0$ ($f \leq 900$ MHz in TEM-cell; $f > 1800$ MHz: R22 waveguide). NORM_{x,y,z} are only intermediate values, i.e., the uncertainties of NORM_{x,y,z} does not effect the E²-field uncertainty inside TSL (see below *ConvF*).
- NORM(f)_{x,y,z}** = NORM_{x,y,z} * *frequency_response* (see Frequency Response Chart). This linearization is implemented in DASY4 software versions later than 4.2. The uncertainty of the frequency response is included in the stated uncertainty of *ConvF*.
- DCP_{x,y,z}**: DCP are numerical linearization parameters assessed based on the data of power sweep (no uncertainty required). DCP does not depend on frequency nor media.
- ConvF and Boundary Effect Parameters**: Assessed in flat phantom using E-field (or Temperature Transfer Standard for $f \leq 800$ MHz) and inside waveguide using analytical field distributions based on power measurements for $f > 800$ MHz. The same setups are used for assessment of the parameters applied for boundary compensation (alpha, depth) of which typical uncertainty values are given. These parameters are used in DASY4 software to improve probe accuracy close to the boundary. The sensitivity in TSL corresponds to NORM_{x,y,z} * *ConvF* whereby the uncertainty corresponds to that given for *ConvF*. A frequency dependent *ConvF* is used in DASY version 4.4 and higher which allows extending the validity from ± 50 MHz to ± 100 MHz.
- Spherical isotropy (3D deviation from isotropy)**: in a field of low gradients realized using a flat phantom exposed by a patch antenna.
- Sensor Offset**: The sensor offset corresponds to the offset of virtual measurement center from the probe tip (on probe axis). No tolerance required.

Additional Conversion Factors for Dosimetric E-Field Probe

Type:	ES3DV2
Serial Number:	3007
Place of Assessment:	Zurich
Date of Assessment:	March 16, 2009
Probe Calibration Date:	March 12, 2009

Schmid & Partner Engineering AG hereby certifies that conversion factor(s) of this probe have been evaluated on the date indicated above. The assessment was performed using the FDTD numerical code SEMCAD of Schmid & Partner Engineering AG. Since the evaluation is coupled with measured conversion factors, it has to be recalculated yearly, i.e., following the re-calibration schedule of the probe. The uncertainty of the numerical assessment is based on the extrapolation from measured value at 900 MHz or at 1810 MHz.

Assessed by: 

Dosimetric E-Field Probe ES3DV2 SN:3007

Conversion factor (\pm standard deviation)

150 MHz	<i>ConvF</i>	$8.2 \pm 10\%$	$\epsilon_r = 52.3$ $\sigma = 0.76$ mho/m (head tissue)
250 MHz	<i>ConvF</i>	$7.5 \pm 10\%$	$\epsilon_r = 47.6$ $\sigma = 0.83$ mho/m (head tissue)
300 MHz	<i>ConvF</i>	$7.4 \pm 9\%$	$\epsilon_r = 45.3$ $\sigma = 0.87$ mho/m (head tissue)
150 MHz	<i>ConvF</i>	$7.9 \pm 10\%$	$\epsilon_r = 61.9$ $\sigma = 0.80$ mho/m (body tissue)
250 MHz	<i>ConvF</i>	$7.5 \pm 10\%$	$\epsilon_r = 59.4$ $\sigma = 0.88$ mho/m (body tissue)
300 MHz	<i>ConvF</i>	$7.4 \pm 9\%$	$\epsilon_r = 58.2$ $\sigma = 0.92$ mho/m (body tissue)

Important Note:

For numerically assessed probe conversion factors, parameters Alpha and Delta in the DASY software must have the following entries: Alpha = 0 and Delta = 1.

Please see also Section 4.7 of the DASY4 Manual.

: The standard deviation for each Conversion factor stated in above numerical assessments were taken at $k = 1$.
