Motorola Personal Communications Sector Product Safety Laboratory

Libertyville, Illinois

Summary of FCC request for additional information

There was a request for additional information regarding Motorola's SAR Test Report for Motorola portable cellular phone (FCC ID IHDT56FR1). The requested information is addressed below in the same numbering sequence received.

2. There are several discrepancies between the model numbers of the various batteries/accessories listed in the body of the SAR report (Section 6.2), the SAR data tables, and the actual SAR plots. Please confirm that these are typos, and that the model numbers listed in Section 6.2 are correct.

**Response:** The fourth paragraph of section 6.2 of the original report should be replaced with the following paragraph:

There is one Body-Worn Accessory, using two belt clips, available for this phone:

Half Leather Case with Tab: VLV2203/SYN1072A

Plastic Belt Clips: SYN8631A (wishbone) and SYN8763A (universal)

This case, and the two belt clips, was used for the SAR body worn measurements. In addition, cabled headset SYN8390B was used for body worn testing.

Additionally, the body worn scan immediately following page 14 of the original test report states the accessory model number to be SYN87963A. This is a typo with the correct model number being SYN8763A.
