The margin with respect to the limit is the minimum margin for all modes and bands.

General and Special Conditions

The test sample was tested using a fully charged battery when applicable. Where a battery could not be used due to the need for a controlled variation of input voltage, an external power supply was utilized.

All testing was done in an indoor controlled environment with an average temperature of 25 $^{\circ}$ C \pm 1 $^{\circ}$ C and relative humidity of 45 % \pm 6 % over the dates used for testing.

Description of Bluetooth (BT) Transmitter

The 23633-1 cell phone sample offers Bluetooth as a feature. The Bluetooth spread-spectrum, frequency hopping transceiver is designed to operate between 2400 and 2483.5 MHz. The Bluetooth antenna is mounted on the PCB inside of the EUT. The antenna installation is permanent. For a more thorough description of the functionality please refer to Exhibit 12 of this package.

As a Bluetooth transmitter, it is designed operate with other Bluetooth devices as defined by the industrial standard. In this application, the test sample is battery-operated.

Measurement Procedures and Data

FIELD STRENGTH OF SPURIOUS EMISSIONS

CFR Part 2.1053, 15.205, 15.209, 15.247

Measurement Procedure

The test sample is placed inside the semi-anechoic chamber on a polystyrene table at the turntable center. For each spurious frequency, the antenna mast is raised and lowered from 1 to 4 meters and the turntable is rotated 360 degrees to obtain a maximum reading on the spectrum analyzer. This is repeated for both horizontal and vertical polarizations of the receive antenna.

For 30 MHz – 18 GHz:

Field Strength ($dB\mu V/m$) = EMI Receiver Level ($dB\mu V$) + Cable Loss (dB) -

Amplifier Gain (dB) + Filter loss (dB) + Antenna

Correction Factor (3/m)

For 18 GHz – 26.5 GHz:

Field Strength (dBμV/m) = EMI Receiver Level (dBμV) + Cable Loss (dB) -

Amplifier Gain (dB) + Filter loss (dB) + Antenna

Correction Factor (1/m)

A fully charged battery was used for the supply voltage.

The test sample was operated during the measurements under the following conditions:

- Tests were performed at low, mid and high channels.
- Tests were performed in both horizontal and vertical polarity.

Measurement Results

For peak emissions detected above 1 GHz, only those emissions that are higher than the AVG limit line plus 8 dB are selected for final emission analysis.

For 30 MHz - 18 GHz:

Field Strength ($dB\mu V/m$) = EMI Receiver Level ($dB\mu V$) + Cable Loss (dB) - Amplifier Gain (dB) + Filter loss (dB) + Antenna

Correction Factor (3/m)

For 18 GHz – 26.5 GHz:

Field Strength ($dB\mu V/m$) = EMI Receiver Level ($dB\mu V$) + Cable Loss (dB) -

Amplifier Gain (dB) + Filter loss (dB) + Antenna

Correction Factor (1/m)

The test sample was operated in Bluetooth single channel test mode. A fully charged battery was used for the supply voltage.

Measurement Results

Comments:

The band edge measurements crossing the corner for the low/high channel with respect to the average limit line is acceptable when applying the FCC rule specified in CFR 47 part 15.35(b) for the use of peak detector above 1 GHz. The peak detector limit line has been added to the graphical plots.

The peak detector limit line has been added to the graphical plots.
