

HAC Test Report for Telecoil IHDT56NQ2

Tests Requested By: Motorola Mobility, Inc.
600 N. US Highway 45
Libertyville, IL 60048

Date of Tests: May 19, 2012
Date of Report: May 21, 2012

Test Laboratory: Motorola Mobility, Inc. - ADR Test Services Laboratory
600 N. US Highway 45
Libertyville, Illinois 60048

Report Author: Katerina Bruggemann
Engineer

Statement of Compliance: Motorola declares under its sole responsibility that portable cellular telephone FCC ID IHDT56NQ2 to which this declaration relates, complies with recommendations and guidelines FCC 47 CFR §20.19. The measurements were performed to ensure compliance to the ANSI C63.19-2007. It also declares that the product was tested in accordance with the appropriate measurement standards, guidelines and recommended practices. Any deviations from these standards, guidelines and recommended practices are noted below:

(none)

Results Summary: T Category = T3

©Motorola Mobility, Inc. 2011

This test report shall not be reproduced except in full, without written approval of the laboratory.

The results and statements contained herein relate only to the items tested. The names of individuals involved may be mentioned only in connection with the statements or results from this report.

Motorola encourages all feedback, both positive and negative, on this test report.

1. Introduction

The Motorola Mobility ADR Test Services Laboratory has performed Hearing Aid Compatibility (HAC) measurements for the portable cellular phone (FCC ID [Insert FCC ID#]). The portable cellular phone was tested in accordance with ANSI C63.19-2007 standard. The test results presented herein clearly demonstrate compliance FCC 47 CFR § 20.19. This report demonstrates compliance for Telecoil performance only and not for near field emissions.

2. Description of the Device Under Test

Table 1: Information for the Device Under Test

Serial number	364PNG06N5								
Mode(s) of Operation	800 iDEN (Interconnect / Dispatch)	800 iDEN (Packet Data)	GSM 1800	GSM 1900	WCDMA 1700	WCDMA 1900	WCDMA 2100	Wi-Fi 802.11b/g/n	Bluetooth
Modulation Mode(s)	M16-QAM	M64-QAM, M16-QAM, QPSK	GMSK	GMSK	QPSK	QPSK	QPSK	BPSK	GFSK
Maximum Output Power Setting	28.06 dBm		30.5 dBm	30.5 dBm	24.0 dBm	24.0 dBm	24.0 dBm	19.25 dBm	8.9 dBm
Duty Cycle	2:6 / 1:6	81:120	1:8	1:8	1:1	1:1	1:1	1:1	1:1
Transmitting Frequency Range(s)	806.0125 – 824.9875 MHz		1710.2 - 1784.8 MHz	1850.20 - 1909.80 MHz	1712.4 – 1752.6 MHz	1852.4 - 1907.6 MHz	1922.4 - 1977.6 MHz	2412.0 - 2462.5 MHz	2402.0 - 2483.5 MHz
Production Unit or Identical Prototype (47 CFR §2.908)	Identical Prototype								
Device Category	Portable								
Supports Voice on Interface	YES	NO	YES	YES	YES	YES	YES	YES (VOIP)	NO
Test requirements defined in C63.19-2007	YES	NO	YES	YES	YES	YES	YES	NO	NO
Supports Simultaneous Operation With	GSM, WCDMA, Wi-Fi, Bluetooth	Bluetooth	iDEN, Wi-Fi, Bluetooth	iDEN, Wi-Fi, Bluetooth	iDEN, Wi-Fi, Bluetooth	iDEN, Wi-Fi, Bluetooth	iDEN, Wi-Fi, Bluetooth	iDEN, GSM, WCDMA	iDEN, GSM, WCDMA

Note: No Bluetooth profile exists in this phone that will allow a Bluetooth link while in a cellular call that passes audio to the earpiece. If the user had Bluetooth enabled and a link established, they could not be listening to the phone through the earpiece.

Note: Wi-Fi capability is included in this phone without measurements for hearing aid compatibility based on the interim ruling by the FCC according to paragraph 37 of the Federal Register, Volume 3, Number 89, as of May 7, 2008. Users shall be informed of this via the product user guide per the same FCC ruling.

3. Test Equipment Used

The Motorola Mobility Inc. ADR Test Services Laboratory utilizes a Dosimetric Assessment System (Dasy4™ v4.7) manufactured by Schmid & Partner Engineering AG (SPEAG™) of Zurich, Switzerland. All Telecoil measurements are taken within a shielded enclosure. The measurement uncertainty budget is given in Appendix 5. The list of calibrated equipment used for the measurements is shown in Table 2.

Table 2: Test Equipment

	Description	Serial Number	Cal Date	Cal Due Date
Dosimetric System Equipment	DAE4	387	Jun-30-2011	Jun-30-2012
	Audio Magnetic 1D Field Probe AM1DV3	3080		
	AMMI SE UMS 010 AA	1005		
	AMCC SD HAC P02 AB	1005		
	Test Arch SD HAC D01 BA	1073		
Additional Test Equipment	Rohde & Schwarz CMU 200	1063388	July-21-2011	July-21-2012

Figure 1: Telecoil setup and cabling (pictures from DASY manual)

AMMI (Audio Magnetic Measurement Instrument) is a desktop unit containing a sampling unit, a waveform generator for test, calibration signals and a USB interface. Front connectors include: Audio Out - predefined or user definable audio signals for injection into the WD; Probe In - the probe signal is evaluated by AMMI; Coil Out - test and calibration signal to the AMCC; Coil In - monitor signal from the AMCC.

Audio Magnetic Probe (AM1DV2) is an active probe with a single sensor. The same probe coil is used to measure three orthogonal field components (axial, radial 1, radial 2). The probe is rotated to properly orient the coil for each field component. Probe's frequency response, linearity and other characteristics are given in the certificate in Appendix 6.

AMCC (Audio Magnetic Calibration Coil) is a Helmholtz coil for calibration of the AM1D probe. The two horizontal coils create a homogeneous magnetic field in the z direction. Refer to Appendix 7 for more details on AMCC coil.

The probe is calibrated in the AMCC coil. The frequency response and sensitivity are measured and stored. Sensitivity includes both probe sensitivity and pre-amplifier sensitivity.

Graph 1: Frequency Response measured in AMCC

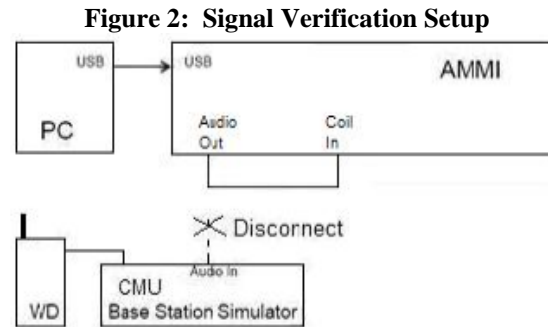

Sensitivity measured in AMCC: 0.00739257 V / (A/m)

The sensitivity is for a 1 kHz sine signal. The sensitivity includes both probe sensitivity and pre-amplifier sensitivity. It is the total calibration, and there are no additional probe calibration factors. The voltage into the Helmholtz coil is across the shunt resistor.

4. Signal Verification

An Input Level is measured to verify that it is within ± 0.2 dB from the Reference Input Level in section 6.3.2.1 of ANSI C63.19-2007.

In Figure 2 setup, “Audio Out” of the AMMI is connected to the “Coil In” of the AMMI. The “Audio Out” of the AMMI is measured using 1V as the reference.

Section 6.3.2.1 of ANSI C63.19-2007 specifies the reference input level to be -16 for GSM/WCDMA and -18 for CDMA. Each CMU has a slightly different “0dBm0 Input Reference” value that must be measured. When the CMU box is replaced or externally re-calibrated, an internal calibration procedure must be completed in each transmission mode. On the CMU 200 (SN 1063388), the 0dBm0 Input Reference value is 0.73 V for GSM/WCDMA. For more information on “0dBm0 Input Reference” measurements, refer to Appendix 3-5.

The Target Level for “Audio Out” of the AMMI is shown in Table 3. This target level takes into account the difference between AMMI’s and CMU’s reference levels.

Table 3: Measured Input Level

Modulation	Reference Input Level from ANSI PC63.19 (dBm0)	CMU’s 0dBm0 Input Reference Value (dB)	Target Level for “Audio Out” of AMMI (dBm0)
GSM/WCDMA	-16	-2.73	-18.73

The signal level for “Audio Out” of the AMMI is measured. Signal Verification has been conducted on the same days as DUT measurements. If it is not within ± 0.2 dB, the gain settings in the DASY template are adjusted. The obtained results are displayed in Table 4.

Table 4: Measured Input Level

Modulation	Measured date	Signal	Measured Level for “Audio Out” of AMMI (dBm0)	Target Level for “Audio Out” of AMMI (dBm0)
GSM / WCDMA	May 19, 2012	Narrowband	-18.77	-18.73
		Broadband	-18.71	

5. Test Results

5.1 Telecoil SNR Results

The phone was tested in normal configurations for against-the-ear use. The DASY4 v4.7 measurement system specified in section 3.1 was utilized within the intended operations as set by the SPEAG™ setup. The Test Arch provided by SPEAG is used to position the DUT. All tests are done via conducted setup with CMU 200. The volume on the phone is adjusted to maximum. Backlight was off during testing, and HAC compliance will be explained in the manual.

The tests are performed with telecoil function enabled. To enable the telecoil function, select:
Main Menu → Settings → In-Call Setup → HAC Mode Settings → [Check box to enable]

The Cellular Phone model covered by this report has the following battery options:
 Model SNN5879A - 1880 mAH battery

The distance is established by positioning the device beneath the test arch phantom so that it is touching the frame. The location and thickness of the arch, and the location/orientation of the coil within the probe housing, are precisely known values in the DASY software. The height of the measurement plane is further fine-tuned by performing a Surface Detection job at the beginning of each test. The end result is that the probe sensor is very precisely located 10 mm above the device reference plane.

ABM2 investigation has been carried out to determine the highest channel / frequency of each applicable frequency band. At the location of the Telecoil source, ABM2 is measured in the axial probe position for each frequency (Table 5). For each band, the channel with the highest ABM2 measurement is highlighted in **bold**.

Table 5: ABM2 measurements across the frequency band for the portable cellular telephone at highest possible output power.

ABM2 Measurements (dB A/m)		
GSM 1900	Ch 512	-36.12
	Ch 661	- 36.19
	Ch 810	- 36.01
WCDMA 1900	Ch 9262	- 50.14
	Ch 9400	- 50.18
	Ch 9538	- 50.18
WCDMA 1700	Ch 1312	-49.44
	Ch 1413	-49.33
	Ch 1513	-49.30

For the channels highlighted in bold in Table 5, Telecoil SNR measurements are shown in Table 6. The sequence of the Telecoil SNR measurement is listed in the steps below.

- a) Geometry & signal check
- b) Background noise measurement. The background noise is measured at the center of the listening area.
- c) Coarse resolution axial scan (narrowband signal, 1 s measurement times, 50 x 50 mm grid with 5.55 mm spacing). Only ABM1 is measured in order to find the location of the Telecoil source.
- d) Fine resolution axial, radial-transverse, & radial-longitudinal scans, positioned appropriately based on optimal ABM1 of coarse resolution axial scan (narrowband signal, 1 s measurement times, variable grid size with 2 mm spacing). Both ABM1 and ABM2 are measured in order to find the location of the SNR point.
- e) ABM1 & ABM2 point measurements in axial, radial-transverse, & radial-longitudinal coil orientations, positioned appropriately based on optimal signal quality of fine resolution scans (narrowband signal, 2 s measurement times). SNR is calculated for each coil orientation.

- f) Frequency Response point measurement in axial coil orientation, positioned appropriately based on optimal signal quality of fine resolution axial scan (broadband signal, 12 s measurement time)

The ABM1, SNR and Telecoil Rating results are shown in Table 6. Also shown are the measured conducted output power, location of the measured point, noise and ABM2. The delta between Ambient Noise measurement and ABM2 measurement should be greater than 10 dB. However, in cases where ABM2 is very low, it is suitable for the delta to be less than 10 dB. For the three probe positions, contour plots for the lowest SNR, indicated in **bold numbers**, are given in Appendix 1. For the three probe positions, noise spectrum plots for the highest ambient noise, indicated with **bold numbers**, are given in Appendix 2. These noise spectrum plots are half band integrated with an A-weighting filter applied.

Telecoil SNR Limits		
ABM 1	Greater or equal to -18 dB A/m	
SNR	T3	Greater than 20 dB
	T4	Greater than 30 dB

Table 6: Telecoil SNR measurement results for the portable cellular telephone at highest possible output power.

Probe Position	Frequency Band (MHz)	Channel	Conducted Output Power (dBm)	Measured Point Location (x mm, y mm)	Ambient Noise (dB A/m)	ABM2 (dB A/m)	ABM2 – Ambient Noise (dB)	ABM1 (dB A/m)	SNR (dB)	Telecoil SNR Rating
Axial	GSM 1900	810	30.62	1.2, -6.7	-55.63	-35.23	20.41	2.127	37.36	T4

5.2 Telecoil Environment Results

Telecoil Environment is determined by analysis of both E-Field scan and H-Field scans in the area of the Telecoil location. The Telecoil location is the earpiece speaker area. The 5cm x 5cm measurement grid is centered on the acoustic output of the device. The probe is raised 15mm from the highest point of the phone’s contour to the center point of the probe element. The phone was tested in normal configurations for the ear use. These configurations are tested at the high, middle and low frequency channels of each applicable frequency band. For more information on the near field measurements on the unit 364PNG06N5, refer to “HAC Test Report for Near Field Emissions IHDT56NQ2” from May 17, 2012.

The worst-case test conditions are indicated with **bold numbers** in the tables and are detailed in Appendix 8: HAC distribution plots for E-Field and H-Field.

Table 7: Telecoil Environment measurement results for the portable cellular telephone at highest possible output power.

6. Measurements for Certification of 3G Devices

For WCDMA devices, 12.2 kbps RMC and 12.2 kbps AMR modes are considered. The conducted power measurements for each mode are shown in the table below.

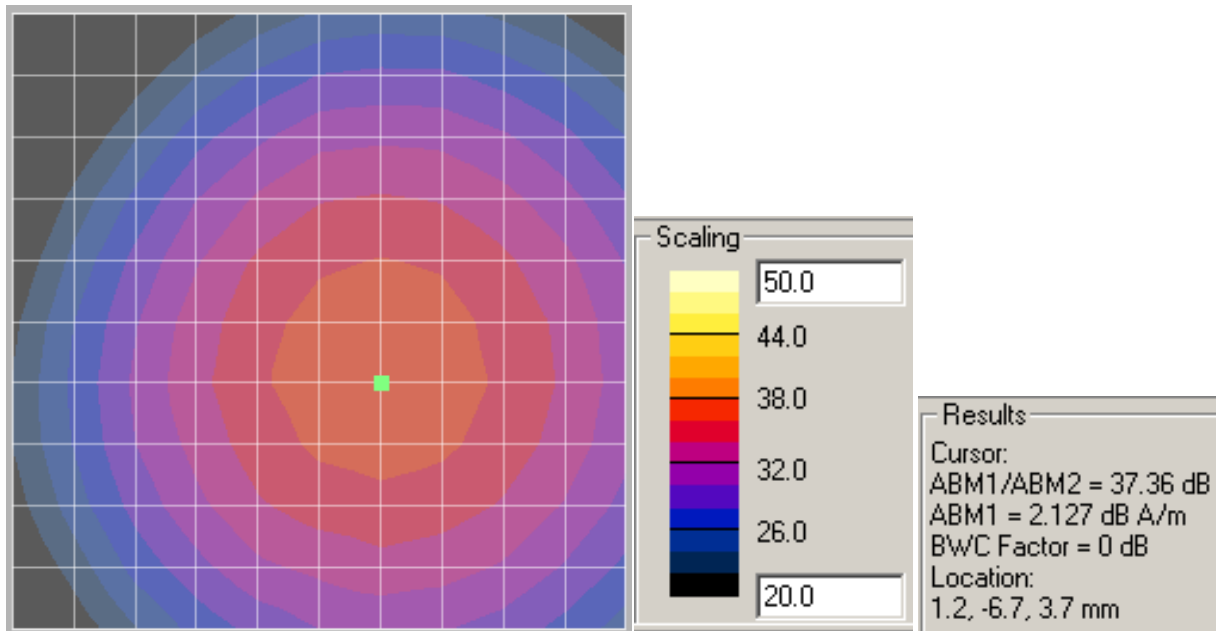

Conducted power (dBm) for WCDMA modes			
	Channel	RMC	AMR
WCDMA 1700	1312	24.12	24.11
	1413	24.11	24.09
	1513	24.04	24.01
WCDMA 1900	9262	23.93	23.96
	9400	23.91	23.88
	9538	23.88	23.86

Details on the Measurement Systems

3-1) Details on ABM2 measurements by the system

(Description provided by Schmid & Partner Engineering, AG):

The processing applies a convolution in the time-domain. This filtering is composed of integrator (straight-forward), Half-Band filter (first-order filter) and A-weighting. The convolved data stream is then integrated over the desired period and represented and stored numerically in DASY4 as the ABM Noise (= ABM2).

During the validation process of our system, the functionality of this process has been verified by debugging the filters step-by-step progressive and comparing the results also with a Rohde & Schwarz UPL Analyzer. The intermediate steps are not accessible in the final software code operated by the end user. In addition, the following verification has been made, using a single frequency (sine) signal: At the reference frequency of 1 kHz, the signal is equivalent to ABM1. ABM1 is visible from the calibration job, inclusive its frequency slope from 100Hz to 5kHz. This function (conversion of the coil voltage to the field) is the same integration function.

The verification of the probe linearity and the linearity of the integrator has been determined and documented in the certificate 880-SP AM1 001 A, inclusive the integrator, over the required frequency range (exceeding 5 kHz). The additional frequency slope of the Half-Band filter and the A-weighting have also been tested by changing the applied frequency over the full range. The attenuation was verified for each third-octave-band and up to > 10 kHz. In addition, the correct processing of multiple sine-wave signals was verified.

The convolutions work over the full frequency range available in the analog path, only limited by AC-coupling at the low end and anti-aliasing filter at the high frequency end. White noise signal without band limitation has not been used for filter measurements. Pink noise, decreasing with frequency, resulting in a frequency independent response of the third-octave filter bank was used to optically verify the correct filtering function. Precision measurements were however made with pure sine signals.

Frequency components beyond the visible range of 5 kHz are contained in the ABM2 figure.

(Measurements made by Motorola):

Comparison of 1kHz narrowband signal driven externally into TMFS coil

ABM1 @ 1kHz	ABM2 @ 1kHz	difference
-25.122	-25.124	0.002 dB

Frequency dependent ABM1 - ABM2 with broadband noise and narrowband tones driven externally into TMFS coil

Frequency	dB difference ABM1-ABM2 broadband signal	dB difference ABM1-ABM2 single frequency signals	ideal value for ABM1-ABM2	variance from ideal broadband	variance from ideal single frequencies
200		22.062	22.35		0.288
250			17.89		
315			14.03

5000	-3.283	-3.336	-3.34	-0.057	-0.004
maximum variation from ideal:				0.328 dB	

3-2) Details on the compliancy of the frequency and linearity response**(Description provided by Schmid & Partner Engineering, AG):**

See also probe certificate of conformity in Appendix 6, titled 880-SP AM1 001 A-A

See also coil certificate of conformity in Appendix 7, titled 880-SD HAC P02A-A

Frequency response has been tested to be within +/- 0.5 dB of ideal differentiator from 100 Hz to 10 kHz. The test was made with the real integrator and deducting the ideal integrator values. Reference signal was the Helmholtz calibration coil current which is equivalent to the field. The coil is qualified according to certificate 880-SD HAC P02 A-A.

The test data up to 5 kHz are visible directly in the calibration job result (coil current / shunt voltage, and probe voltage). Separate measurements were made for a very wide frequency range, including higher frequencies. For the third-octave bands up to 5 kHz do not exceed 0.05 dB and decay by < 0.2 dB to 5 kHz and by < 0.5 dB to 10 kHz, as required.

Linearity has also been tested and is stated in the certificate. Deviation was not measurable from 5 dB below limitation to 26 dB above noise level. For lower levels, the deviation increased to 0.1 dB at 16 dB above noise level, which corresponds to the theoretical value of 0.11 dB expected at that noise suppression level.

Significant noise contribution beyond 10 kHz will be attenuated by the convoluting A-filter as explained in answer #2. Such interferences contribute also to ABM2 represented as numerical value from the integration.

3-3) Details on Measurements by the systems

Details regarding timing and averaging of the reported final measured points are as follows:

	Narrowband Signal	Broadband Signal
Signal Length (sec):	1	2
Total Data Acquisition Time per Location (sec):	2	12
	Averaging is over 2 signal repetitions	Averaging is over 6 signal repetitions

The broadband signal utilized is shown in the following plot:

Mathematical processing is not required because the preferred method (as described in IEEE ANSI C63.19-2007 section 6.3) is utilized. The broadband audio signal is used only for assessment of frequency response. The DASY4 system corrects for the spectral response after measurement since it knows the spectrum of the input signal. However, please note that for the signal that we use, the spectrum is flat when measured in 1/3 octave bands, covering the range up to 3kHz.

The narrowband signal utilized is shown in the following plot:

3-4) Details of the source audio signals for all aspects of the test

Here is the temporal response of the narrow band signal. The signal is one second of the standard P.50 speech band limited to the ANSI 1kHz 1/3 octave band. The signal is Hann windowed to ensure continuity of the signal.

Here is the temporal response of the 300Hz-3kHz broadband signal. The signal is a 2 second segment of the standard P.50 speech that is equalized flat (for ANSI 1/3 octaves) over the 300Hz to 3kHz range. The signal is Hann windowed to ensure continuity of the signal.

3-5) Details of the CMU-200 “0dBm0 Input Reference value”**Measure “Ref Input Level”**

- a) Generate a 1 kHz Sine Signal using AMMI.
- b) Capture a signal level using AMMI.
- c) Record the value as the "Ref Input Level"

Measure Value “X”

- d) Connect CMU to AMMI.
- e) Connect a phone which operates in the desired modulation to the CMU. Establish a call to the CMU. Select Decoder Cal on CMU.
- f) Capture a signal level from CMU using AMMI.
- g) Record the value as the "Value X".

Measure Value “M”

- h) Make another connection from AMMI to CMU. Change to Encoder Cal on CMU.
- i) Generate a 1 kHz Sine Signal using AMMI
- j) Capture a signal from CMU using AMMI.
- k) Record the value as the "Value M".

Calculate the resulting Input Correction Factor & the 0dBm0 Input Reference

Relevant Equations:

Measured values from above: Ref Input Level, X, M

Input Correction Factor = Ref Input Level + X – M

0dBm0 Input Reference = $10^{(\text{Input Corr Factor}/20)}$ * CMU-200 manual ref value

Audio Magnetic Probe Certificate

Accredited by the Swiss Accreditation Service (SAS)
The Swiss Accreditation Service is one of the signatories to the EA
Multilateral Agreement for the recognition of calibration certificates
Client **Motorola MDb**

Accreditation No.: **SCS 108**

Certificate No: **AM1DV3-3080_Nov10**

CALIBRATION CERTIFICATE

Object **AM1DV3 - SN: 3080**

Calibration procedure(s) **QA CAL-24.v2
Calibration procedure for AM1D magnetic field probes and TMFS in the
audio range**

Calibration date: **November 29, 2010**

This calibration certificate documents the traceability to national standards, which realize the physical units of measurements (SI).
The measurements and the uncertainties with confidence probability are given on the following pages and are part of the certificate.

All calibrations have been conducted in the closed laboratory facility: environment temperature (22 ± 3)°C and humidity < 70%.

Calibration Equipment used (M&TE critical for calibration)

Primary Standards	ID #	Cal Date (Certificate No.)	Scheduled Calibration

Description of the AM1D probe

The AM1D Audio Magnetic Field Probe is a fully shielded magnetic field probe for the frequency range from 100 Hz to 20 kHz. The pickup coil is compliant with the dimensional requirements of [1]. The probe includes a symmetric low noise amplifier for the signal available at the shielded 3 pin connector at the side. Power is supplied via the same connector (phantom power supply) and monitored via the LED near the connector. The 7 pin connector at the end of the probe does not carry any signals, but determines the angle of the sensor when mounted on the DAE. The probe supports mechanical detection of the surface.

The single sensor in the probe is arranged in a tilt angle allowing measurement of 3 orthogonal field components when rotating the probe by 120° around its axis. It is aligned with the perpendicular component of the field, if the probe axis is tilted nominally 35.3° above the measurement plane, using the connector rotation and sensor angle stated below.

The probe is fully RF shielded when operated with the matching signal cable (shielded) and allows measurement of audio magnetic fields in the close vicinity of RF emitting wireless devices according to [1] without additional shielding.

Handling of the item

The probe is manufactured from stainless steel. In order to maintain the performance and calibration of the probe, it must not be opened. The probe is designed for operation in air and shall not be exposed to humidity or liquids. For proper operation of the surface detection and emergency stop functions in a DASY system, the probe must be operated with the special probe cup provided (larger diameter).

Methods Applied and Interpretation of Parameters

- *Coordinate System:* The AM1D probe is mounted in the DASY system for operation with a HAC Test Arch phantom with AMCC Helmholtz calibration coil according to [2], with the tip pointing to "southwest" orientation.
- *Functional Test:* The functional test preceding calibration includes test of Noise level
RF immunity (1kHz AM modulated signal). The shield of the probe cable must be well connected.
Frequency response verification from 100 Hz to 10 kHz.
- *Connector Rotation:* The connector at the end of the probe does not carry any signals and is used for fixation to the DAE only. The probe is operated in the center of the AMCC Helmholtz coil using a 1 kHz magnetic field signal. Its angle is determined from the two minima at nominally +120° and -120° rotation, so the sensor in the tip of the probe is aligned to the vertical plane in z-direction, corresponding to the field maximum in the AMCC Helmholtz calibration coil.
- *Sensor Angle:* The sensor tilting in the vertical plane from the ideal vertical direction is determined from the two minima at nominally +120° and -120°. DASY system uses this angle to align the sensor for radial measurements to the x and y axis in the horizontal plane.
- *Sensitivity:* With the probe sensor aligned to the z-field in the AMCC, the output of the probe is compared to the magnetic field in the AMCC at 1 kHz. The field in the AMCC Helmholtz coil is given by the geometry and the current through the coil, which is monitored on the precision shunt resistor of the coil.

AM1D probe identification and configuration data

Item	AM1DV3 Audio Magnetic 1D Field Probe
Type No	SP AM1 001 BA
Serial No	3080

Overall length	296 mm
Tip diameter	6.0 mm (at the tip)
Sensor offset	3.0 mm (centre of sensor from tip)
Internal Amplifier	20 dB

Certificate of conformity

Item	Audio Magnetic 1D Field Probe AM1DV2, AM1DV3
Type No	SP AM1 001 A, SP AM1 001 B
Series No	1001ff, 3000 ff
Manufacturer / Origin	Schmid & Partner Engineering AG Zeughausstrasse 43, CH-8004 Zürich, Switzerland

Description of the item

AM1DVx is a fully RF shielded magnetic field probe for the frequency range from 100 Hz to 20 kHz which can be used in the close vicinity of RF emitting devices according to [1] without additional shielding. Its sensor coil is compliant with the dimensional requirements of [1] and allows measurement of 3 orthogonal field components by rotating the probe around its axis in a tilted arrangement according to [2]. The signal from the pickup coil is amplified in a symmetric low noise amplifier with a gain of 40 dB (V2) or 20 dB (V3) and a 3 dB decay at approx. 60 kHz. A 3 pin connector at the side provides the output signal to a shielded cable and allows power supply (monitored via LED).

Handling of the item

The probe is designed for operation in air (shall not be exposed to humidity of liquids). In order to keep the performance and alignment, the probe must not be disassembled. The full performance is achieved by using the SPEAG provided accessories (shielded cable and probe beaker) in conjunction with the Audio Magnetic Measurement Instrument AMMI with 48V phantom supply and following manual [2].

Tests

Test	Requirement	Details	Units tested
Dimensions	according to corresponding probe certificate	verified at delivery / light beam alignment prior to usage	samples
Connector rotation angle	probe configuration data for alignment of the sensor in the field	probe tilted 35.3° above measurement plane	all
Sensor angle	probe configuration data for alignment with the field	probe tilted 35.3° above measurement plane	all
Frequency response	within +/- 0.5 dB of ideal differentiator	100 Hz to 10 kHz	samples
Noise level	V2: ABM2 typ. -69 dB A/m V3: ABM2 typ. -62 dB A/m	with AMMI, magnetically shielded tip	all
Max. signal	V2: ABM1 < 20 dB A/m @ 1 kHz V3: ABM1 < 40 dB A/m @ 1 kHz	with AMMI	all
Linearity	within < 0.1 dB from 5 dB below limitation to 16 dB above noise level	with AMMI	samples
Sensitivity	V2: typ. 0.066 V / (A/m) V3: typ. 0.0073 V / (A/m)	at 1 kHz	all

Appendix 7

AMCC Certificate (Helmholtz Coil)

Certificate of conformity

Item	Audio Magnetic Calibration Coil AMCC
Type No	SD HAC P02 A
Series No	1001 ff.
Manufacturer / Origin	Schmid & Partner Engineering AG Zurich, Switzerland

Description of the item

The Audio Magnetic Calibration coil (AMCC) is a Helmholtz Coil designed according to standard [1], section D.9 for calibration of the AM1D probe. Two horizontal coils are positioned above a non-metallic base plate and generate a homogeneous magnetic field in the z direction (normal to it).

Configuration

The AMCC consists of two parallel coils of 20 turns with radius 143 mm connected in parallel in a distance of 143 mm. With this design, a current of 10 mA produces a field of 1 A/m. The DC input resistance at the input BNC socket is adjusted by a series resistor to a DC resistance of approximately 50 Ohm. The voltage required to produce a field of 1 A/m is consequently approx. 500 mV.

The current through the coil is monitored via a shunt resistor of 10 Ohm +/- 1%. The voltage is available on a BNO socket with 100 mV corresponding to 1 A/m.

Handling of the item

The coil shall be positioned in a non-metallic environment to avoid distortion of the magnetic field.

Tests

Test	Requirement	Details	Units tested
Number of turns	N = 20 per coil	Resistance measurement	all
Orientation of coils	parallel coils with same direction of windings	Magnetic field variation in the AMCC axis	all
Coil radius	r = 143 mm	mechanical dimension	First article
Coil distance	d = 143 mm distance between coil centers	mechanical dimension	First article
Input resistance	51.7 +/- 2 Ohm	DC resistance at BNC input connector	all
Shunt resistance	R = 10.0 Ohm +/- 1 %	DC resistance at BNO output connector	all
Shunt sensitivity	Hc = 1 A/m per 100 mV according to formula $Hc = (U / R) * N / r / (1.25^{*1.5})$	Field measurement compared with Narda ELT400 + BN2300/90.10	First article

Standards
