

## TEST PROCEDURE

GENERAL: This report shall NOT be reproduced except in full without the written approval of TIMCO ENGINEERING, INC. The UUT was transmitting a test signal during the testing.

RADIATION INTERFERENCE: The test procedure used was ANSI STANDARD C63.4-1992 using a HEWLETT PACKARD spectrum analyzer with a preselector. The analyzer was calibrated in dB above a microvolt at the output of the antenna. The resolution bandwidth was 100KHz and the video bandwidth was 300KHz up to 1.0GHz and 1.0MHz with a video BW of 3.0MHz above 1.0GHz. The hopping was stopped at the low, middle, & high end of the band and the UUT measured. The ambient temperature of the UUT was 85Deg F with a humidity of 89.2%. The hopping was stopped at the low end, middle and high end of the band in order to test the radiated emissions.

FORMULA OF CONVERSION FACTORS: The Field Strength at 3m was established by adding the meter reading of the spectrum analyzer (which is set to read in units of dBuV) to the antenna correction factor supplied by the antenna manufacturer. The antenna correction factors are stated in terms of dB. The gain of the Preselector was accounted for in the Spectrum Analyzer Meter Reading.

Example:

Freq (MHz)	METER READING + ACF = FS
33	20 dBuV + 10.36 dB = 30.36 dBuV/m @ 3m

8. Electro-Metric Line Impedance Stabilization Network Model No. EM-7820, Serial No. 2682; 10KHz-30MHz 50uH. 9/30/97

## INTRODUCTION: GENERAL INFORMATION AND DATA

PRODUCT DESCRIPTION The IMKAP2-1020 is a frequency hopping radio LAN which consists of several separate blocks. The controller is responsible for all interfacing and receives and responds to all incoming events. The controller executes a multitasking kernel which resides in internal memory. The controller powers up and down the receiver section, transmitter, the time base and power management.
