2 Test Configuration of Equipment under Test

2.1 Test Manner

- The EUT has been associated with peripherals pursuant to ANSI C63.4-2003 and configuration operated in a manner tended to maximize its emission characteristics in a typical application.
- For spurious emission below 1GHz, only one channel of each application was tested because it is not related to channel selection.
- The EUT is programmed to transmit signal continuously for all testings.
- Frequency range investigated: conduction 150 kHz to 30 MHz, radiation 30 MHz to 25000MHz.
- Router and Access Point have the same main board, antenna and RF portion, only the port number and the driver are different. Therefore, the radiated emission testings are mainly focused on Router.
- There are 3 dipole antennas, only the highest gain (5 dBi) Dipole was tested.
- One of the testing modes from Router+5 dBi Dipole antenna was tested for AP+2 dBi PCB antenna.
