Re: Limited Modular Approval, FCC ID JI9-F22-24E0032

Dear Reviewer:

The above-referenced product contains a PLL-based synthesizer capable of producing any frequency in the range 425.24 to 435.00 MHz. Products will be assigned a frequency in this range at the time of manufacture. No customer can set any transmitter outside this frequency range in any way.

Customers can copy an entire program from another transmitter which includes its frequency and transfer that unaltered program and unaltered frequency to another transmitter, for instance to make a back-up transmitter.

Some customers can change the transmitter's programming (through a Windows-based PC program) but are restricted from changing the frequency. So in all cases the possible frequencies have been initially set at the time of manufacture. No customer can set any transmitter outside the frequency range in any way.

Sincerely,

A handwritten signature in black ink that reads "Steven C. Habisohn".

Steven C. Habisohn

President
