HID Global Corporation
6533 Flying Cloud Drive
Eden Prairie, MN 55344

Dear Robert Cresswell,

Enclosed is the EMC test report for compliance testing of the HID Global Corporation, Model: 20K, tested to the requirements of Title 47 of the CFR, Part 15.225, Subpart C for Certification as an Intentional Radiator.

Thank you for using the services of Eurofins MET Labs, Inc. If you have any questions regarding these results or if MET can be of further service to you, please feel free to contact me.

Sincerely yours,
EUROFINS MET LABS, INC.

Engineering Statement: The measurements shown in this report were made in accordance with the procedures indicated, and the emissions from this equipment were found to be within the limits applicable. I assume full responsibility for the accuracy and completeness of these measurements, and for the qualifications of all persons taking them. It is further stated that upon the basis of the measurements made, the equipment tested is capable of operation in accordance with the requirements of the FCC Rules Part 15.225 under normal use and maintenance.

Jonathan Tavira,
Manager, Electromagnetic Compatibility Lab

I. Executive Summary

A. Purpose of Test

An EMC evaluation was performed to determine compliance of the HID Global Corporation Model: 20K, with the requirements of Part 15, §15.225. All references are to the most current version of Title 47 of the Code of Federal Regulations in effect. In accordance with §2.1033, the following data is presented in support of the Certification of the Model: 20K. HID Global Corporation should retain a copy of this document which should be kept on file for at least two years after the manufacturing of the Model: 20K, has been **permanently** discontinued.

B. Executive Summary

The following tests were conducted on a sample of the equipment for the purpose of demonstrating compliance with Part 15, §15.225, in accordance with HID Global Corporation, purchase order number HID000518. All tests were conducted using measurement procedure ANSI C63.10-2013.

FCC Reference 47 CFR Part 15.225	Description	Compliance Model: 20K Pigtail	Compliance Model: 20K Terminal
Part 15 §15.203	Antenna Requirement	Compliant	Compliant
Part 15 §15.207(a)	Conducted Emission Limits	Compliant	Compliant
Part 15 §15.215	20dB Occupied Bandwidth	Compliant	Compliant
Part 15 §15.225(a)	Field Strength emissions within the band 13.553 – 13.567 MHz	Compliant	Compliant
Part 15 §15.225(b)	Field Strength emissions within the band 13.410 – 13.553 MHz and 13.567 – 13.710 MHz	Compliant	Compliant
Part 15 §15.225(c)	Field Strength emissions within the band 13.110 – 13.410 MHz and 13.710 – 14.010 MHz	Compliant	Compliant
Part 15 §15.225(d)	Outside-Band Field Strength emissions per 15.209 – 13.110 – 14.010 MHz	Compliant	Compliant
Part 15 §15.225(e)	Frequency Tolerance of the Carrier	Compliant	Compliant

Figure 1: Executive Summary of EMC Part 15.225 Compliance Testing

II. Equipment Configuration

A. Overview

Eurofins MET Labs, Inc. was contracted by HID Global Corporation to perform testing on the Model: 20K, under HID Global Corporation's purchase order number HID000518.

This document describes the test setups, test methods, required test equipment, and the test limit criteria used to perform compliance testing of the HID Global Corporation, Model: 20.

The results obtained relate only to the item(s) tested.

Models Tested:	20K Pigtail and Terminal	
Models Covered:	20K	
EUT Specifications:	Primary Power: 12VDC	
	FCC ID: JQ6-SIGNO20K	
	Type of Modulations:	FSK
	Equipment Code:	DXX
	Peak Field Strength:	35.98 dB μ V/m
	Operating Frequency:	13.56 MHz
	Antenna Type:	Inductive Loop
	Antenna Gain:	1 dBi
	Firmware Version:	R9.1.0.19
Analysis:	The results obtained relate only to the item(s) tested.	
Environmental Test Conditions:	Temperature: 15-35° C	
	Relative Humidity: 30-60%	
	Barometric Pressure: 860 – 1060 mbar	
Evaluated by:	Adan Arab	
Report Date:	January 10, 2020	

Figure 2: EUT Summary Table

B. References

Figure 3: References

C. Test Site

All testing was performed at Eurofins MET Labs, Inc., 13501 McCallen Pass, Austin, TX 78753. All equipment used in making physical determinations is accurate and bears recent traceability to the National Institute of Standards and Technology.

Radiated Emissions measurements were performed in a 3 meter semi-anechoic chamber (equivalent to an Open Area Test Site). In accordance with §2.948(a)(3), a complete site description is contained at MET Laboratories.

Correlation between semi-anechoic chamber and OATS:

Two calibrated Loop antennas were used on an OATS. One antenna was driven by a signal generator with a known power. The receive antenna was initially placed 1m away from the transmit antenna. The two antennas were placed parallel to each other. The receive antenna was in turn connected to a calibrated spectrum analyzer. The emissions were swept from 9 kHz to 30 MHz. The receive antenna was then rotated 90 Degrees and measurements re-taken. Additional measurements were taken when the receive antenna was placed at 3meters. This same setup was taken to inside the semi-anechoic chamber and the measurements repeated.

The data was used to correlate the semi-anechoic chamber and OATS.

D. Measurement Uncertainty

Test Method	Typical Expanded Uncertainty	K	Confidence Level
RF Frequencies	±4.52 Hz	2	95%
RF Power Conducted Emissions	±2.32 dB	2	95%
RF Power Conducted Spurious Emissions	±2.25 dB	2	95%
RF Power Radiated Emissions	±3.01 dB	2	95%

Figure 4: Uncertainty Calculations Summary

E. Description of Test Sample

The Model: 20K, Equipment Under Test (EUT) is typically installed near doorway as part of physical access system, to control access to that door. A user will approach the door and present a BLE or RFID credentials to the reader with intention of entering the door. The reader will read the credential and send its data to a connected access control panel, which determine whether or not grant the user access to the door. Optionally, a personal identification number (PIN) may also be required, in which case the user will enter the PIN on the reader's keypad.

Figure 5: Block Diagram of Test Configuration

F. Equipment Configuration

The EUT was set up as outlined in **Figure 5**. All equipment incorporated as part of the EUT is included in the following list.

Ref. ID	Slot #	Name / Description	Model Number	Part Number	Serial Number	Rev. #
	N/A	HID Signo Reader	20K	N/A	N/A	N/A

Figure 6: Equipment Configuration

G. Support Equipment

Support equipment necessary for the operation and testing of the EUT is included in the following list.

Ref. ID	Slot #	Name / Description	Model Number	Part number	Serial Number	Rev. #
N/A	N/A	12VDC Source	DURACELL Battery	N/A	N/A	N/A
N/A	N/A	Tablet	Galaxy Tab 4	N/A	N/A	N/A

Figure 7: Support Equipment

H. Ports and Cabling Information

Ref. ID	Port name on EUT	Cable Description or reason for no cable	Qty	Length as tested (m)	Max Length(m)	Shielded? (Y/N)	Termination Box ID & Port Name
1	+VDC	Power	1	0.3	0.3	Y	
2	GND	Power	1	0.3	0.3	Y	
3	Data1	Data	1	0.3	0.3	Y	
4	Data0	Data	1	0.3	0.3	Y	
5	GLD	Data	1	0.3	0.3	Y	
6	RLY1	Data	1	0.3	0.3	Y	
7	RLY2	Data	1	0.3	0.3	Y	
8	RLED	Data	1	0.3	0.3	Y	
9	HOLD	Data	1	0.3	0.3	Y	
10	Beep	Data	1	0.3	0.3	Y	

Figure 8: Ports and Cabling

I. Mode of Operation During Testing

A 12V DC provided to the EUT, once booting process done and LED's on readers turn solid RED the unit is ready to be tested. An HF/LF credential were presented to the reader for a continuously operation. The unit will beep every few seconds and LED's flashing constantly means that the unit is reading and data is going back and forth between the credential and the reader. In order to operate the BT radio, a tablet was paired to the unit via BT link and signal information presented via the HID app to insure connection is constant.

J. Modifications

a) Modifications to EUT

No modifications were made to the EUT.

b) Modifications to Test Standard

No modifications were made to the test standard.

K. Disposition of EUT

The test sample including all support equipment submitted to the Electro-Magnetic Compatibility Lab for testing was returned to HID Global Corporation upon completion of testing.

III. Electromagnetic Compatibility Criteria for Intentional Radiators

§ 15.203 Antenna Requirement

Test Requirement: § 15.203: An intentional radiator shall be designed to ensure that no antenna other than that furnished by the responsible party shall be used with the device. The use of a permanently attached antenna or of an antenna that uses a unique coupling to the intentional radiator shall be considered sufficient to comply with the provisions of this section. The manufacturer may design the unit so that a broken antenna can be replaced by the user, but the use of a standard antenna jack or electrical connector is prohibited.

The structure and application of the EUT was analyzed to determine compliance with Section 15.203 of the Rules. Section 15.203 states that the subject device must meet at least one of the following criteria:

- a.) Antenna must be permanently attached to the unit.
- b.) Antenna must use a unique type of connector to attach to the EUT.
- c.) Unit must be professionally installed. Installer shall be responsible for verifying that the correct antenna is employed with the unit.

Model: 20K Pigtail

Test Results: The EUT is **compliant** with the requirement of §15.203. The 20K-Pigtail Card Reader implements a loop antenna that is permanently installed. Therefore, the 20K-Pigtail Card Reader satisfies the all requirements under section 15.203.

Test Engineer: Jonathan Tavira

Test Date: September 17, 2019

Model: 20K Terminal

Test Results: The EUT as tested is **compliant** with the requirements of § 15.203 Antenna Requirement. The 20K-Terminal Card Reader implements a loop antenna that is permanently installed. Therefore, the 20K-Terminal Card Reader satisfies the all requirements under section 15.203.

Test Engineer: Jonathan Tavira

Test Date: September 12, 2019

Electromagnetic Compatibility Criteria for Intentional Radiators

§ 15.207(a) Conducted Emissions Limits

Test Requirement(s): § 15.207 (a): For an intentional radiator that is designed to be connected to the public utility (AC) power line, the radio frequency voltage that is conducted back onto the AC power line on any frequency or frequencies, within the band 150 kHz to 30MHz, shall not exceed the limits in the following table, as measured using a 50 μ H/50 Ω line impedance stabilization network (LISN). Compliance with the provisions of this paragraph shall be based on the measurement of the radio frequency voltage between each power line and ground at the power terminal. The lower limit applies at the boundary between the frequency ranges.

Frequency range (MHz)	§ 15.207(a), Conducted Limit (dB μ V)	
	Quasi-Peak	Average
* 0.15 – 0.5	66 – 56	56 – 46
0.5 – 5	56	46
5 – 30	60	50

Figure 9: Conducted Limits for Intentional Radiators from FCC Part 15 § 15.207(a)

Note: *Decreases with the logarithm of the frequency.

Test Procedure: The EUT was placed on a 0.8 m-high non-conducting table above a ground plane. The EUT was situated such that the back of the EUT was 0.4 m from one wall of the vertical ground plane, and the remaining sides of the EUT were no closer than 0.8 m from any other conductive surface. The EUT was powered from a 50 Ω /50 μ H Line Impedance Stabilization Network (LISN). The EMC receiver scanned the frequency range from 150 kHz to 30 MHz. Conducted Emissions measurements were made in accordance with ANSI C63.10-2013 "Procedures for Compliance Testing of Unlicensed Wireless Devices". The measurements were performed over the frequency range of 0.15 MHz to 30 MHz using a 50 Ω /50 μ H LISN as the input transducer to an EMI receiver. For the purpose of this testing, the transmitter was turned on at full power during scans.

Sample Calculation:

$$R_r - S = M$$

where:

- R_r = Receiver Reading in dB μ V
- S = Specification Limit in dB μ V
- M = Margin to Specification in +/- dB

Sample formula for calculating the Corrected Data for the Conducted Emissions Measurements:

Line	Freq (MHz)	Uncorrected QP** Amplitude (dB μ V)	LISN IL (dB)	CBL (dB)	Corrected QP** Amplitude (dB μ V)	QP** Limit (dB μ V)	Delta (dB)	Results
XYZ	0.18	42.65	10	0.58	53.23	79	-25.77	Pass

*Corrected QP** Amplitude (dB μ V) = Uncorrected Amplitude (dB μ V) + LISN IL (dB) + CBL (dB) = 42.65 + 10 + 0.58 = 53.23*

*** Same Calculation applies to Corrected Avg. amplitude as well.*

Electromagnetic Compatibility Criteria for Intentional Radiators

§ 15.215(c) 20 dB Occupied Bandwidth

Test Requirement(s): § 15.215 (c) Intentional radiators operating under the alternative provisions to the general emission limits, as contained in §§15.217 through 15.257 and in subpart E of this part, must be designed to ensure that the 20 dB bandwidth of the emission, or whatever bandwidth may otherwise be specified in the specific rule section under which the equipment operates, is contained within the frequency band designated in the rule section under which the equipment is operated. In the case of intentional radiators operating under the provisions of subpart E, the emission bandwidth may span across multiple contiguous frequency bands identified in that subpart. The requirement to contain the designated bandwidth of the emission within the specified frequency band includes the effects from frequency sweeping, frequency hopping and other modulation techniques that may be employed as well as the frequency stability of the transmitter over expected variations in temperature and supply voltage. If frequency stability is not specified in the regulations, it is recommended that the fundamental emission be kept within at least the central 80% of the permitted band in order to minimize the possibility of out-of-band operation.

Test Procedure: The transmitter was on and transmitting at the highest output power. The bandwidth of the fundamental frequency was measure with the spectrum analyzer using an RBW approximately 1% of the total emission bandwidth. The 20 dB Bandwidth was measured and recorded.

Model: 20K Pigtail

Test Results: The EUT as tested is **compliant** with the requirements of § 15.215(c) 20 dB Occupied Bandwidth. No anomalies noted.

Test Engineer: Adan Arab

Electromagnetic Compatibility Criteria for Intentional Radiators

§ 15.225(a) Spurious Emission Limits, within the band 13.553 – 13.567 MHz

Test Requirement(s): 15.225 (a) The field strength of any emissions within the band 13.553 – 13.567 MHz shall not exceed 15,848 microvolts/meter at 30 meters.

Test Procedure: The EUT was set to transmit and placed on a 0.8m-high acrylic table inside a semi-anechoic chamber. The method of testing and test conditions of ANSI C63.4: 2014 and ANSI C63.10: 2013 were used. The loop antenna was located 3 m from the EUT. Measurements were conducted with the loop antenna at coaxial (parallel) and planar (perpendicular) orientations. The Spectrum analyzer RBW was set to 10 kHz and VBW was set to 30 kHz. A peak detector was used.

The measurements were made at 3m and then extrapolated to 30m using the following correction factor.

$$40\log(3/30) = -40 \text{ dB}$$

Figure 45: Spurious Emission Limits, within the bands 13.110 – 13.410 MHz and 13.710 – 14.010 MHz, Terminal, 13.710 MHz – 14.010 MHz, 90 Deg

Electromagnetic Compatibility Criteria for Intentional Radiators

§ 15.225(d) Spurious Emission Limits, outside the bands 13.110 – 14.010 MHz

Test Requirement(s): 15.225 (d) The field strength of any emissions appearing outside of the 13.110–14.010 MHz band shall not exceed the general radiated emission limits in § 15.209.

Test Procedure: The EUT was set to transmit and placed on a 0.8m-high wooden stand inside a semi-anechoic chamber. The method of testing and test conditions of ANSI C63.4: 2014 and ANSI C63.10: 2013 were used. For measurements below 30 MHz a loop antenna placed 3m away from the unit was used. For measurements above 30 MHz a biconalog antenna placed 10m away from the unit was used. Measurements were conducted with the loop antenna at coaxial (parallel) and planar (perpendicular) orientations. The Spectrum analyzer RBW was set to 10 kHz and VBW was set to 30 kHz. Below 150 kHz, the RBW was set to 300 Hz and the VBW set to 1 kHz. Above 30 MHz, the RBW was set to 100 kHz and the VBW set to 300 kHz. A peak detector was used below 30 MHz and a Quasi-peak detector was used for measurements for above 30 MHz.

The measurements made at 3m with the loop antenna were then extrapolated to 30m or 300 m using the following correction factors.

$$40\log(3/30) = -40 \text{ dB}$$

$$40\log(3/300) = -80 \text{ dB}$$

The measurements made at 10m with the biconilog antenna were then extrapolated to the 3m using the following correction factor.

$$20\log(10/3) = +10.46 \text{ dB}$$

Spurious Emissions Test Setup

Figure 46: Radiated Spurious Emissions Test Setup

Sample Calculation for Distance Correction factor (DCF) measurement:

$$F_d = 20 \cdot \log_{10} (D_m/D_s)$$

where:

F_d = Distance Factor in dB

D_m = Measurement Distance in meters

D_s = Specification Distance in meters

Sample formula for calculating the Corrected Data for the Radiated Emissions Measurements:

Frequency (MHz)	Antenna Polarity	EUT Azimuth (Degrees)	Antenna Height (cm)	Uncorrected Amplitude (dBμV/m)	ACF (dB/m) (+)	Pre Amp Gain + CBL (dB)(-)	DCF (dB) (+)	Corrected Amplitude (dBμV/m)	Limit (dBμV/m)	Margin (dB)
249.99	V	359.9	240.7	55.46	11.4	28.335	10.46	38.525	47	-8.475

$$\begin{aligned} \text{Corrected Amplitude (dB}\mu\text{V/m)} &= \text{Uncorrected Amplitude (dB}\mu\text{V/m)} + \text{ACF (dB/m)} - (\text{Preamp Gain (dB)} + \text{CBL (dB)} + \text{DCF (dB)})^{**} \\ &= 55.46 + 11.4 - 28.355 + 10.46 = 38.525 \end{aligned}$$

** DCF Column represents the appropriate correction factor used when the measurement distance differs from the specification distance.

Electromagnetic Compatibility Criteria for Intentional Radiators

§ 15.225(e) Frequency Stability

Test Requirement(s): 15.225(e) The frequency tolerance of the carrier signal shall be maintained within $\pm 0.01\%$ of the operating frequency over a temperature variation of -20 Degrees to +50 Degrees C at normal supply voltage, and for a variation in the primary supply voltage from 85% to 115% of the rated supply voltage at a temperature of 20 Degrees C. For battery operated equipment, the equipment tests shall be performed using a new battery.

Test Procedure: Measurements are in accordance with Part 2.1055. The EUT was placed in the Environmental Chamber and allowed to reach desired temperature. A spectrum analyzer was used to measure the frequency drift. The EUT was set to transmit in the operating frequency range. Frequency drift was investigated for the extreme temperatures and nominal temperature, until the unit is stabilized then recorded the reading in tabular format with the temperature range of -20° to 50°C.

Figure 69: Temperature Stability Test Setup

Model: 20K Pigtail

Test Results: The EUT as tested is **compliant** with the requirements of § 15.225(e) Frequency Stability. No anomalies noted.

Test Engineer: Adan Arab

Test Date: August 12, 2019

Test Data, Model: 20K Pigtail

Operating Frequency	13,560,000 Hz
