## TABLE OF CONTENTS

**CKC Laboratories, Inc. has Certificates of Accreditation from the following agencies**:
DATech (Germany); A2LA (USA); FCC (USA); VCCI (Japan); BSMI (Taiwan); HOKLAS (Hong Kong).
**CKC Laboratories, Inc. has Letters of Acceptance through an MRA for the following agencies:**
ACA/NATA (Australia); SABS (South Africa); SWEDAC (Sweden); TUV Rheinland-Germany; TUV Rheinland-Korea; TUV Rheinland-Russia; Radio Communications Agency (RA); NEMKO (Norway).

## ADMINISTRATIVE INFORMATION

| | |
|---|---|
| **DATE OF TEST:** | November 9-11, 1999 |
| **PURPOSE OF TEST:** | To demonstrate the compliance of the 4043A (4043-300) AMH100 Handheld Reader, with the requirements for FCC Part 15 Subpart C and FCC Part 2.1043(b)(2) Permissive Change II devices. |
| **MANUFACTURER:** | HID Corporation<br>9292 Jeronimo<br>Irvine, CA 92618-1905 |
| **REPRESENTATIVE:** | Frank de Vall |
| **TEST LOCATION:** | CKC Laboratories, Inc.<br>5473A Clouds Rest<br>Mariposa, CA 95338 |
| **TEST PERSONNEL:** | Dustin Oaks |
| **TEST METHOD:** | ANSI C63.4 1992 |
| **FREQUENCY RANGE TESTED:** | 9 kHz – 1000 MHz |
| **EQUIPMENT UNDER TEST:** | **Handheld Reader**<br>Manuf: HID Corporation<br>Product: AMH100 Handheld Reader<br>Model: 4043A<br>Final Assy: 4043-300<br>Serial: 2099-00272<br>FCC ID: JQ64043 |

## SUMMARY OF RESULTS

The HID Corporation 4043A (4043-300) AMH100 Handheld Reader, was tested in accordance with ANSI C63.4 1992 for compliance with FCC Part 15 Subpart C and FCC Part 2.1043(b)(2) Permissive Change II.

As received, the above equipment was found to be fully compliant with the limits of FCC Part 15 Subpart C and FCC Part 2.1043(b)(2) Permissive Change II. The results in this report apply only to the items tested, as identified herein.

## PERMISSIVE II CHANGE DESCRIPTION

1) The Reader will now operate with a personal computer in addition to a portable data terminal.
2) There are now 4 transmitter power levels instead of the previous 8 power levels. The transmit timings have also changed.

## EQUIPMENT UNDER TEST (EUT) DESCRIPTION

Hand held reader capable of reading from and writing to the Atmel AT24RF08 tag when used in conjunction with a host computer.

## MEASUREMENT UNCERTAINTY

Associated with data in this report is a ±4dB measurement uncertainty.

## EUT OPERATING FREQUENCY

The EUT was operating at 0.125 MHz.

## TEMPERATURE AND HUMIDITY DURING TESTING

The temperature during testing was within +15°C and + 35°C.
The relative humidity was between 20% and 75%.

**PERIPHERAL DEVICES**

The EUT was tested with the following peripheral device(s):

**PC**
Manuf: IBM
Model: 310ED
Serial: 60A1130
FCC ID: HLZ 315

**Power Supply**
Manuf: Ault
Model: SC102TA0503F01
Serial: N/A
FCC ID: DoC

## REPORT OF MEASUREMENTS

The following tables report the six highest worst case levels recorded during the tests performed on the 4043A (4043-300) AMH100 Handheld Reader. All readings taken are peak readings unless otherwise noted by a "Q" or "A". The data sheets from which these tables were compiled are contained in Appendix B.

**Table 1: Six Highest Radiated Emission Levels- (9kHz-30MHz)**

| FREQUENCY | METER READING | CORRECTION FACTORS | | | | CORRECTED READING | SPEC LIMIT | MARGIN | NOTES |
|---|---|---|---|---|---|---|---|---|---|
| | | Ant | Amp | Cable | FCC 15.31 | | | | |
| MHz | dBµV | dB | dB | dB | dB | dBµV/m | dBµV/m | dB | |
| **0.125Fundamental** | **41.5** | **10.5** | | | **-40.0** | **12.0** | **25.7** | **-13.7** | **N** |
| 0.250 | 26.9 | 10.6 | | | -40.0 | -2.5 | 19.6 | -22.1 | N |

COMMENTS: EUT is operating in a normal configuration, reading a tag located in the field. The laptop is running PROXTRAK Demo software, version 3. EUT receives DC power via an AC/DC adapter connected to the laptop's RS232 port. Modified unit.

## TABLE A

## LIST OF TEST EQUIPMENT

### Barn Lab

1. Spectrum Analyzer, Hewlett Packard, Model No. 8566B, CKC 1, S/N 2403A08241 (Display Unit), S/N 2209A01404 (rf Unit). Calibration date: July 7, 1999. Calibration due date: July 7, 2000.

2. Preamp, Hewlett Packard, Model No. 8447D, S/N 1937A02604. Calibration Date: April 28, 1999. Calibration Due: April 28, 2000.

3. Quasi-Peak Adapter, Hewlett Packard, Model No. 85650A, S/N 2811A01267. Calibration Date: July 7, 1999. Calibration Due: July 7, 2000.

4. Biconical Antenna, A & H Systems, Model No. SAS-200/542, S/N 156. Calibration Date: May 20, 1999. Calibration Due: May 20, 2000.

5. Log Periodic Antenna, A & H Systems, Model No. SAS-200/512, S/N 154. Calibration Date: May 20, 1999. Calibration Due: May 20, 2000.

6. Mag Loop Antenna, EMCO, Model 6502, S/N 1074. Calibration date: June 16, 1999. Calibration due date: June 16, 2000.

7. LISN (FCC), Solar Electronics, S/N 855996, 992. Calibration date: June 4, 1999. Calibration due date: June 4, 2000.

8. Mariposa Site B (Barn). Calibration date: July 6, 1999. Calibration due date: July 6, 2000.

9. Test software, EMI Test 3.08.

**EUT SETUP**

The equipment under test (EUT) and the peripheral(s) listed were set up in a manner that represented their normal use. Any special conditions required for the EUT to operate normally are identified in the comments that accompany Tables 1-3 for radiated and conducted emissions. Additionally, a complete description of all the ports and I/O cables is included on the information sheets contained in Appendix A.

During radiated emissions testing, the EUT was mounted on a nonconductive, rotating table 80 cm above the conductive grid. The nonconductive table dimensions were 1 meter by 1.5 meters. This configuration is typical for radiated emissions testing of handheld devices.

I/O cables were connected to the EUT and peripherals in the manner required for normal operation of the system. Excess cabling was bundled in the center in a serpentine fashion using 30-40 centimeter lengths.

During conducted emissions testing, the EUT was located on a wooden table measuring approximately 80 cm high, 1 meter deep, and 1.5 meters in length. One wall of the room where the EUT is located, has a minimum 2 meter by 2 meter conductive plane. The EUT was mounted on the wooden table 40 cm away from the conductive plane, and 80 cm from any other conductive surface.

The vertical metal plane used for conducted emissions was grounded to the earth. Power to the EUT was provided through a LISN. The LISN was grounded to the ground plane. All other objects were kept a minimum of 80 cm away from the EUT during the conducted test. Conducted emissions tests required the use of the LISN's listed in Table A.

## TEST INSTRUMENTATION AND ANALYZER SETTINGS

The test instrumentation and equipment listed in Table A were used to collect both the radiated and conducted emissions data for the 4043A (4043-300) AMH100 Handheld Reader. For radiated measurements below 30 MHz, the magloop antenna was used at distance of 30 meters from the edge of the EUT. For radiated measurements 30-300 MHz, the biconical antenna was used at a distance of 3 meters form the EUT. For frequencies from 300 to 1000 MHz, the log periodic antenna was used at a distance of 3 meters from the EUT. Conducted emissions tests required the use of the FCC type LISN's.

The HP spectrum analyzer was used for all measurements. Table B shows the analyzer bandwidth settings that were used in designated frequency bands. For conducted emissions, an appropriate reference level and a vertical scale size of 10 dB per division were used. A 10 dB external attenuator was also used during conducted tests, with internal offset correction in the analyzer. During radiated testing, the measurements were made with 0 dB of attenuation, a reference level of 97 dBµV, and a vertical scale of 10 dB per division.

TABLE B : ANALYZER BANDWIDTH SETTINGS PER FREQUENCY RANGE

| TEST | BEGINNING FREQUENCY | ENDING FREQUENCY | BANDWIDTH SETTING |
|---|---|---|---|
| CONDUCTED EMISSIONS | 450 kHz | 30 MHz | 9 kHz |
| RADIATED EMISSIONS | 9 kHz | 150 kHz | 200 Hz |
| RADIATED EMISSIONS | 150 kHz | 30 MHz | 9 kHz |
| RADIATED EMISSIONS | 30 MHz | 1000 MHz | 120 kHz |

## SPECTRUM ANALYZER DETECTOR FUNCTIONS

The notes that accompany the measurements contained in Tables 1, 2 and 3 indicate the type of detector function used to obtain the given readings. Unless otherwise noted, all readings were made in the "Peak" mode. Whenever a "Quasi-Peak" or "Average" reading is listed as one of the six highest readings, this is indicated as a "Q" or an "A" in the appropriate table. The following paragraphs describe in more detail the detector functions and when they were used to obtain the emissions data for the 4043A (4043-300) AMH100 Handheld Reader.

### Peak

In this mode, the Spectrum Analyzer or test engineer recorded all emissions at their peak value as the frequency band selected was scanned. By combining this function with another feature of the analyzer called "peak hold," the analyzer had the ability to measure transients or low duty cycle transient emission peak levels. In this mode the analyzer made a slow scan across the frequency band selected and measured the peak emission value found at each frequency across the band.

### Quasi-Peak

When the true peak values exceeded or were within 2 dB of the specification limit, quasi-peak measurements were taken using the HP Quasi-Peak Adapter for the HP Spectrum Analyzer. The detailed procedure for making quasi peak measurements contained in the HP Quasi-Peak Adapter manual were followed.

### Average

When the frequencies are less than 30 MHz, average measurements may be made using the spectrum analyzer. To make these measurements, the test engineer reduces the video bandwidth on the analyzer until the modulation of the signal is filtered out. At this point the analyzer is set into the linear mode and the scan time is reduced.

## TEST METHODS

The radiated and conducted emissions data of the 4043A (4043-300) AMH100 Handheld Reader, was taken with the HP Spectrum Analyzer. Incorporating the applicable correction factors for distance, antenna, cable loss and amplifier gain, the data was reduced as shown in the "Sample Calculations". The corrected data was then compared to the FCC Part 15, Subpart C (and Permissive Change II) emissions limits to determine compliance.

Preliminary and final measurements were taken in order to better ensure that all emissions from the EUT were found and maximized.

### Radiated Emissions Testing

During the preliminary radiated scan, the EUT was powered up and operating in its defined FCC test mode with the I/O cables and line cords facing the antenna. The frequency ranges below 30 MHz were scanned using the magnetic loop antenna. The frequency range of 30 MHz - 88 MHz was then scanned with the biconical antenna located about 1.5 meter above the ground plane in the vertical configuration. During this scan, the turntable was rotated and all peaks, which were at or near the limit, were recorded. The frequency range of 100 - 300 MHz was scanned with the biconical antenna in the same manner, and the peaks recorded. Lastly, a scan of the FM band from 88 - 110 MHz was made, using a reduced resolution bandwidth and a reduced frequency span. The biconical antenna was changed to the horizontal polarity and the above steps were repeated. After changing to the log periodic antenna in the horizontal configuration, the frequency range of 300 - 1000 MHz was scanned. The log periodic antenna was changed to the vertical polarity and the frequency range of 300 - 1000 MHz was again scanned. Care was taken to ensure that no frequencies were missed within the FM and TV bands. An analysis was performed to determine if the signals that were at or near the limit were caused by an ambient transmission. If unable to determine by analysis, the equipment was powered down to make the final determination if the EUT was the source of the emission.

For the final radiated scan, the equipment was again positioned with its I/O and power cables facing the antenna. A thorough scan of all frequencies was manually made using a small frequency span, rotating the turntable as needed. Comparison with the previously recorded measurements was then made.

Using the peak readings from both scans as a guide, the test engineer then maximized the readings with respect to the table rotation, antenna height and configuration of the peripherals and cables. Maximizing of the cables was achieved by monitoring the spectrum analyzer on a closed circuit television monitor while the EUT cables were being moved and rearranged on the EUT table for maximum emissions. Photographs showing the final worst case configuration of the EUT are contained in Appendix A.

**Conducted Emissions Testing**

For conducted emissions testing, a 30 to 50 second sweep time was used for automated measurements in the frequency bands of 450 kHz to 1.705 MHz, 1.705 MHz to 3 MHz, and 3 MHz to 30 MHz. All readings within 20 dB of the limit were recorded. At frequencies where the recorded emissions were close to the limit, further investigation was performed manually at a slower sweep rate.

**Power Output Measurement**

At a distance of 30 meters, the maximum ERP for 4043A (4043-300) AMH100 Handheld Reader was measured at 52 dBuV/m. In accordance with 15.31, a 40 dB correction factor was used to adjust the distance. The factor corrected the reading to 12 dBuV/m.

## SAMPLE CALCULATIONS

The basic spectrum analyzer reading was converted using correction factors as shown in the emissions readings in Tables 1, 2 and 3. For radiated emissions in dBµV/m, the spectrum analyzer reading in dBµV was corrected by using the following formula:

Meter reading (dBµV)
+ Antenna Factor (dB)
+ Cable Loss (dB)
- Distance Correction (dB)
- Pre-amplifier Gain (dB)

= Corrected Reading (dBµV/m)

This reading was then compared to the applicable specification limit to determine compliance.

A typical data sheet will display the following in column format:

| # | Freq MHz | Rdng dBuV | Cable | Amp | Bicon | Mag | Log | Dist Table | Corr dBuV/m | Spec | Margin | Polar |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | LISN | FCC 15.31 | | | | | | | | | | |

**#** means reading number
**Freq MHz** is the frequency in MHz of the obtained reading.
**Rdng dBuV** is the reading obtained on the spectrum analyzer in dBµV.
**Amp** is short for the preamplifier factor or gain in dB.
**Bicon** is the biconical antenna factor in dB.
**Log** is the log periodic antenna factor in dB.
**Mag** is the magnetic loop antenna factor in dB.
**Cable** is the cable loss in dB of the coaxial cable on the OATS.
**Dist** is the distance factor (in dB). It is used when testing at a different test distance than the one stated in the spec.
**Corr dBµV/m** is the corrected reading which is now in dBµV/m (field strength).
**Spec** is the specification limit (dB) stated in the agency's regulations.
**Margin** is the closeness to the specified limit in dB; + is over and - is under the limit.
**Polar** is the Polarity of the antenna with respect to earth.
**LISN** is the listen factor in dB.
**FCC 15.31** is the average correction called in FCC Part 15.31.

Test Location: CKC Laboratories, Inc. • 5473A Clouds Rest • Mariposa, CA 95338 • (800)-500-4EMC

Customer: **HID Corporation**
Specification: **FCC 15.207**
Work Order #: **73039** Date: Thu Nov-11-1999
Test Type: **Conducted Emissions** Time: 15:17:07
Equipment: **Access Control** Sequence#: 9
Manufacturer: HID Corporation Tested By: Dustin Oaks
Model: 4043A (4043-300)
S/N: 2099-00272

***Equipment Under Test* (* = EUT):**

| Function | Manufacturer | Model # | S/N |
|---|---|---|---|
| Access Control* | HID Corporation | 4043A (4043-300) | 2099-00272 |

***Support Devices:***

| Function | Manufacturer | Model # | S/N |
|---|---|---|---|
| PC | IBM | 310ED | 60A1130 |
| Power Supply | Ault | | |

***Test Conditions / Notes:***

EUT is operating in a normal configuration, reading a tag located in the field. The laptop is running PROXTRAK Demo software, version 3. EUT receives DC power via an AC/DC adapter connected to the laptop's RS232 port. Modified unit.
