Date: 2 Feb. 2000

FCC ID: JRR24TA-90IR

SUMMARY OF TEST

Administrative Data and Test Description

DEVISE TESTED: Video Transmitter
Model: Minilink 2.4TA-90IR

APPLICANT: MICROTEK ELECTRONICS, Inc.
P.O. Box 3464
San Clemente, CA 92672

GRANTEE CODE: JRR

FCC ID# REQUESTED: JRR24TA-90IR
CONTACT: Michael L. Henkoski

FREQUENCY RANGES: CONDUCTED: 0.45 – 30.0 mHz
RADIATED: 10-22,000 mHz

TEST LOCATION: 114 Olinda Drive, Brea, CA 92683

TEST DATE: January 10th, 2000

PURPOSE OF TEST: To demonstrate compliance with limits
of FCC Part 90

TESTS PERFORMED: 1) 2.995 Frequency Stability. –30 to +50 C
2) 2.993 Radiated Spurious Emissions.
3) 2.991 Conducted Spurious Emissions.
4) 2.989 Occupied Bandwidth.
5) 2.987 Modulation Characteristics.
6) 2.985 RF Power Output
7) 2.995 Voltage Stability

1.2 Radiated Spurious Emissions

3 Meters

	Antenna Polarity	Preamplifier Gain	Antenna Factor With Feedline		True Fieldstrength
2474 mHz -32.6	V	0	32.7	=	+0.1
4948 mHz -52.3	V	23.3	38.0	=	-37.6
2474 mHz -34.0	H	0	32.3	=	-1.3
4948 mHz -54.6	H	23.3	38.0	=	-39.9
2458 mHz -38.9	V	0	32.7	=	-6.2
4916 mHz -54.6	V	23.3	38.0	=	-39.9
2458 mHz -28.1	H	0	32.7	=	+4.6
4916 mHz -57.3	H	23.3	38.0	=	-42.6

$$\begin{aligned}
 \text{Field Strength} &= 1/D \sqrt{P_o \times R_L} \\
 &= 1/3 \sqrt{.250 \times 50\Omega} \\
 &= 1.177 \text{ V@}50\Omega \\
 &= 14.43 \text{ dBm}
 \end{aligned}$$

$$\begin{aligned}
 \text{FCC Limit} &= 43 + 10 \text{ Log } (.250) \\
 &= -36.98\text{dBc} \\
 &= 14.43\text{dBm} - 36.98 \\
 &= -22.6 \text{ dBm}
 \end{aligned}$$

Spectrum scans were made up to the 10th harmonic as per section 2.997 with all radiated spurious emissions above the 2nd harmonic unmeasurable or greater than 20 dB below the limit.

1.4 Occupied Bandwidth and Modulation Characteristics

2 Plots showing Occupied BW and Modulation at each channel setting. 2458 mHz and 2474 mHz.

The emissions designator 16MOF3F was arrived at by the following method:

1. Bandwidth was determined using the following formula:

$2M+2D$ = Necessary Bandwidth, where M = highest modulation frequency and D = peak deviation.

Maximum modulation frequency = 4 mHz video modulation.

Deviation = 4 mHz.

$$2 \times 4,000,000 = 8,000,000 + 2 \times 4,000,000 = 16\text{mHz}$$

$$= 16\text{MO}$$

2. Modulation type is Frequency modulation, one analog channel Television.

$$= \text{F3F}$$

3. Emission designator is: 16MOF3F

Effective 1-16-99

7. TEST PROCEDURES

The following sections describe the test methods and the specifications for the tests. Test results are also included in this section.

7.1 Conducted Emissions Test

The spectrum analyzer was used as a measuring meter. The data was collected with the spectrum analyzer in the peak detect mode with the "Max Hold" feature activated. The quasi-peak was used only where indicated in the data sheets. A 10 dB attenuation pad was used for the protection of the spectrum analyzer input stage, and the offset was adjusted accordingly to read the actual data measured. The LISN output was measured using the spectrum analyzer. The output of the second LISN was terminated by a 50 ohm termination. The effective measurement bandwidth used for this test was 9 kHz.

Please see section 6.2 of this report for mounting, bonding and grounding of the EUT. The EUT was powered through the LISN, which was bonded to the ground plane. The LISN power was filtered and the filter was bonded to the ground plane. The EUT was set up with the minimum distances from any conductive surfaces as specified in ANSI C63.4: 1992. The excess power cord was wrapped in a figure eight pattern to form a bundle not exceeding 0.4 meters in length.

The conducted emissions from the EUT were maximized for operating mode as well as cable placement. The final data was collected under program control by the HP software in several overlapping sweeps by running the spectrum analyzer at a minimum scan rate of 10 seconds per octave.

7.2

Radiated Emissions (Spurious and Harmonics) Test

The spectrum analyzer was used as a measuring meter along with the quasi-peak adapter. Amplifiers were used to increase the sensitivity of the instrument. The Com Power Preamplifier Model: PA-102 was used for frequencies from 30 MHz to 1 GHz, and the Com-Power Microwave Preamplifier Model: PA-122 was used for frequencies above 1 GHz. The spectrum analyzer was used in the peak detect mode with the "Max Hold" feature activated. In this mode, the spectrum analyzer records the highest measured reading over all the sweeps.

For the peak readings below 1000 MHz that were within 3 dB of the spec limit or higher, the quasi-peak adapter was used.

For the peak readings above 1000 MHz that were within 3dB of the spec limit or higher, the readings were averaged manually by narrowing the video filter down to 1 Hz and slowing the sweep time to keep the amplitude reading calibrated.

The measurement bandwidths and transducers used for the radiated emissions test were:

FREQUENCY RANGE	EFFECTIVE MEASUREMENT BANDWIDTH	TRANSDUCER
9 kHz to 150 kHz	200 Hz	Active Loop Antenna
150 kHz to 30 MHz	9 kHz	Active Loop Antenna
30 MHz to 300 MHz	120 kHz	Biconical Antenna
300 MHz to 1 GHz	120 kHz	Log Periodic Antenna
1 GHz to 22 GHz	1 MHz	Horn Antenna

The open field test site of Compatible Electronics, Inc. was used for radiated emission testing. This test site is set up according to ANSI C63.4: 1992. Please see section 6.2 of this report for mounting, bonding and grounding of the EUT. The turntable supporting the EUT is remote controlled using a motor. The turntable permits EUT rotation of 360 degrees in order to maximize emissions. Also, the antenna mast allows height variation of the antenna from 1 meter to 4 meters. Data was collected in the worst case (highest emission) configuration of the EUT. At each reading, the EUT was rotated 360 degrees and the antenna height was varied from 1 to 4 meters (for E field radiated field strength). The gunsight method was used when measuring with the horn antenna in order to ensure accurate results.

The presence of ambient signals was verified by turning the EUT off. In case an ambient signal was detected, the measurement bandwidth was reduced temporarily and verification was made that an additional adjacent peak did not exist. This ensures that the ambient signal does not hide any emissions from the EUT. The EUT was tested at a 3 meter distance to obtain final test data.
