

Report No.: T180105W02-MF

FCC ID: KR5TIS-10

According to KDB 447498 section 4.3.1, the 1-g SAR test exclusion thresholds at test separation distance ≤ 50 mm are determined by:

[(max. power of channel, including tune-up tolerance, mW) / (min. test separation distance, mm)] $* \cdot [\sqrt{f(GHz)}] \le 3.0$

The tune-up power is 9dBm +/- 1dB, therefore the highest tune-up power is 10.0 dBm (10.00000 mW) @ 315.00 MHz

When the minimum *test separation distance* is < 5 mm, a distance of 5 mm according to 5) in section 4.1 is applied to determine SAR test exclusion.

So,

 $(10.0000 \text{mW} / 5 \text{mm}) * (0.31500 \text{GHz} ^0.5) = 1.12250$

[(max. power of channel, including tune-up tolerance, mW) / (min. test separation distance, mm)] * [$\sqrt{f(GHz)}$] = 1.12250 < 3.0

Therefore, standalone SAR measurements are not required for both head and body.
