Test Requirement:	FCC 47CFR 15.231e
Test Method:	ANSI C63.4:2000
Test Date:	2003-07-14
Mode of Operation:	On mode

**Test Method:**

The sample was placed 0.8m above the ground plane on the OATS \*. Measurements in both horizontal and vertical polarities were performed. During the test, each emission was maximized by: having the EUT continuously working, investigate all operating modes, rotated about all 3 axis (X, Y & Z) to obtain worst position, manipulating interconnecting cables, rotating turntable, varying antenna height from 1m to 4m in both horizontal and vertical polarization. The emissions worst-case are shown in Test Results of the following pages.

\*: OATS [Open Area Test Site] located at HKSTC with a metal ground plane on filed with the FCC pursuant to section 2.948 of the FCC rules, with Registration Number: 90657.

#### **Test Method:**

The bandwidth is measured at an amplitude level reduced from the reference level by a specified ratio. The reference level is the level of the highest amplitude signal observed from the transmitter at the fundamental frequency. Once the reference level is established, the equipment is conditioned with typical modulating signal to produce the worst-case (i.e. the widest) bandwidth.

### Duty Cycle Correction During 100msec

Each function key sends a different series of characters, but each packet period (95.2msec) never exceeds a series of 25 long and short (367 $\mu$ sec) pulses. Assuming any combination of short and long pulses may be obtained due to encoding the worse case transmit duty cycle would be considered  $25 \times 490\mu$ sec per 95.2msec=12.8% duty cycle. Figure A through C show the characteristics of the pulse train for one of these functions.

Remarks:

Duty Cycle Correction =  $20 \log(0.128) = -17.8$ dB

The following figures [Figure A to Figure C] showed the characteristics of the pulse train for one of these functions.

The transmitter is a one button transmitter for registration. The EUT to transmit while button is being pressed. The EUT ceases transmission almost immediately upon being released and appears to finish the current packet being transmitted. The following figure D shown the duration of register transmission.

### **Periodic Operation [FCC 47CFR 15.231e]**

According to FCC 47CFR15.231e. The EUT shall be provided with a means for automatically limiting operation so that the duration of each transmission shall not be greater than one second and the silent period between transmissions shall be at least 30 times the duration of the transmission but in no case less than 10 seconds.

#### **Results:**

Since the EUT of each transmission is 900msec, so the silent period must not less than 27 seconds (900msec x 30).

The following figures [Figure E to Figure F] showed the duration of each transmission and silent period.
