

## Analysis Report

The Equipment Under Test (EUT), is a portable 2.4GHz Transceiver (Plane Unit) for a RC Plane set. The sample supplied operated on 55 channels, normally at 2418 - 2472 MHz for transmitter and receiver. The channels are separated by 1MHz channel spacing.

The EUT is powered by 1 x 3.7V rechargeable battery. After switching on the EUT, the Plane will be moved upward and downward based on the switches pressed in the controller.

Antenna Type: Internal, Integral antenna

Antenna Gain: 0dBi

Nominal rated field strength is 90.2 dB $\mu$ V/m at 3m

Maximum allowed production tolerance: +/- 3dB

According to the KDB 447498:

Based on the Maximum allowed field strength of production tolerance was 93.2dB $\mu$ V/m at 3m in frequency 2.472GHz.

Thus, it below calculated field strength according to minimum SAR exclusion threshold level as follows:

The worst case of SAR Exclusion Threshold Level:

=  $3.0 * (\text{min. test separation distance, mm}) / \sqrt{\text{freq. in GHz}}$

=  $3.0 * 5 / \sqrt{2.483.5 \text{ mW}}$

= 9.52 mW

According to the KDB 412172 D01:

$\text{EIRP} = [(\text{FS} * \text{D})^2 * 1000 / 30]$

Calculated Field Strength for 9.52mW is 105dB $\mu$ V/m @3m

Since maximum field strength plus production tolerance <= 105dB $\mu$ V/m @3m and antenna gain is >= 0.0dBi, it is concluded that maximum Conducted Power and Field Strength are well below the SAR Exclusion threshold level, so the EUT is considered to comply with SAR requirement without testing.
