Subject: RE: Modular application for" ID M4Y-325H2"

Dear Bill,

You asked about how my client will restrict sales to
embedded system applications and here below are
four points to explain how:

1. The PCMCIA module will be installed on a router, not a PC.
What I said in my first e-mail is not correct. I double check with
my client, and he confirm it.
2. The EUT with PCMCIA interface will disable the function
of transmitter when the PCMCIA module plugged in notebook or
PC due to a CIS protection code written in the firmware.
3. For EMC test, the EUT is tested with PC and special
software driver is offered, for EMC test only, to release the
CIS code and enable the function of transmitter. The driver won't
be released except for EMC test purpose!
4. The PCMCIA module will be sold to the manufacturer of router.
With the PCMCIA connector built in the router to connect EUT, transmitter
will be able to function.
If you have any questions, please feel free to let me !

Thanks & Best Regards,

JT Chen
