Test Method:

The sample was placed 0.8m above the ground plane on the OATS *. Measurements in both horizontal and vertical polarities were performed. During the test, each emission was maximized by: having the EUT continuously working, investigate all operating modes, rotated about all 3 axis (X, Y & Z) to obtain worst position, manipulating interconnecting cables, rotating turntable, varying antenna height from 1m to 4m in both horizontal and vertical polarizations. The emissions worst-case are shown in Test Results of the following pages.

*: OATS [Open Area Test Site] located at HKSTC with a metal ground plane on filed with the FCC pursuant to section 2.948 of the FCC rules, with Registration Number: 90657.

| Test Method: | ANSI C63.4:2000 |
| Test Date: | 2002-03-11 |
| Mode of Operation: | On mode |

Test Method:

The test was performed in accordance with ANSI C63.4:2000, with the following: an initial measurement was performed in peak and average detection mode on the live line. Any emissions recorded within 30dB of the relevant limit line were re-measured using quasi-peak and average detection on the live and neutral lines with the worst case recorded in the table of results.

Test Setup:

3.2 26dB Bandwidth of Fundamental Emission

|--------------------|----------------------------------|
| Test Requirement: | FCC 47 CFR 15.235 |
| Test Method: | ANSI C63.4:2000 (Section 13.1.7) |
| Test Date: | 2002-03-11 |
| Mode of Operation: | On mode |

Test Method:

The bandwidth is measured at an amplitude level reduced from the reference level by a specified ratio. The reference level is the level of the highest amplitude signal observed from the transmitter at the fundamental frequency. Once the reference level is established, the equipment is conditioned with typical modulating signal to produce the worst-case (i.e. the widest) bandwidth.

A 1KHz tone and other audio signal were used with audio volume set to maximum for worst case.

Test Setup:

As Test Setup of clause 3.1.1 in this test report.
